Milestone 1: Formal Game Proposal

1 Game Description

We are planning to create a multiplayer turn-based game that contains time travel features, procedurally generated maps, and explosions via particle simulations. We draw inspiration from popular titles such as *Bomberman* for showing blast in maze, *Quantum League* or *Life is Strange* for their time travel features and *Candy Crush Saga* for the cascaded effects. *Rebomb* demonstrates the theme "Chain Reaction" in its mechanics by explosions of bombs. An active bomb affects nearby passive bombs, causing them to trigger and explode. Additionally, flammable objects such as oil buckets, haystacks, wooden fences and trees will be available on the map and players can use these items to their advantage. The game will be designed on several levels. In each round the player has resources that will be carried in the next rounds. The player gains progressively more resources for the chain reactions. Later rounds players can unlock powerful and more costly bombs with their survival bonus.

Figure 1: Chain Reaction.

1.1 Gameplay

Rebomb is a turn-based, maze-based multiplayer game that can be played with 2 or 4 players. The players can only move horizontally or vertically in a 2.5D map containing obstacles and collectibles. To win the game, players must eliminate all opponents and remain the last one standing. Players can get killed once they get caught up in a bomb's explosion, including their own. The bombs have to be strategically placed to destroy obstacles or kill other players. They explode in horizontal and vertical directions after some time causing a cascaded effect. Different types of bombs vary in their impact radius, with each type affecting the explosion distance to a greater or lesser extent.

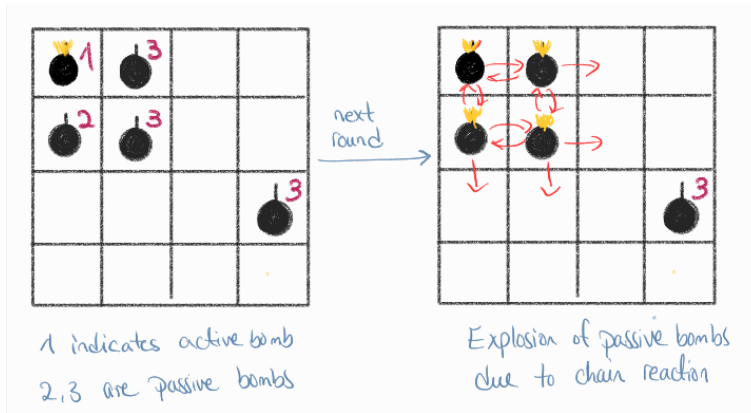

Figure 2: Passive and Active Bomb differentiation.

1.2 Game Mechanics

The player starts the game with fixed and limited resources. Resources can be measured by the number of coins a player holds. Placing the bombs costs coins. Various bombs have different costs. In each round, the player can move only n tiles in horizontal or vertical directions and place their bombs. Resources can be gathered by items on the map, by killing other players, or by designing an in-game interest system, so that the player gains more resources in the upcoming rounds, once they survive the round. The map consists of collectibles, such as hourglasses for time traveling, power-ups for stronger bombs, or extra coins. Once an hourglass is collected the player may choose to time travel back k rounds. In the context of this game, time travel means rewinding to a previous state of the map, where the position of the players, the resources, and all bombs, except for the last placed bombs by each player, will be reverted for all the players. This way the player with time-traveling ability has a chance to strategically change the course of the game in their own favour. Figure 3 demonstrates how time travel can be in a 1 versus 1 gameplay. Note that the same mechanic can also be applied when 4 players are in the game. In this example one bomb costs two coins and the players can move up to 3 tiles in each round.

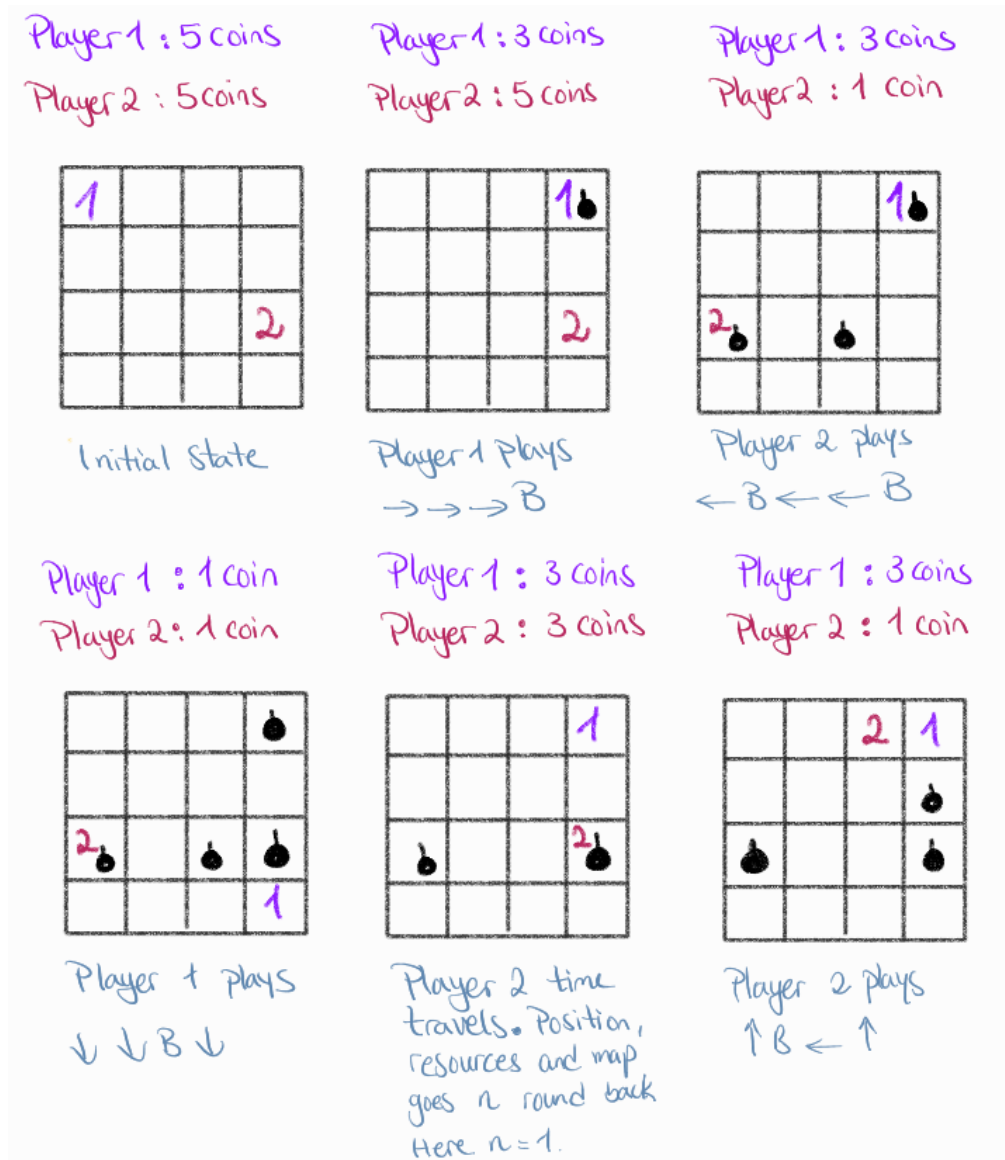

Figure 3: Time Travel Example.

2 Technical Achievement

2.1 Game Snapshots Recording

Our main technical achievement will be the implementation of a game state recording system to enable time travel mechanics. The system will save snapshots of key states including all necessary information to replay the game (movements, actions, objects, environment, etc). This will allow players to interact with previous game experiences, allowing them to explore alternative strategies and making time travel a functional and engaging game mechanic.

2.2 Multiplayer Functionality

Our game will support a multiplayer mode, allowing players to compete in the same scenario in real-time. This feature will require careful management of game states to ensure a minimal latency between devices so

Figure 4: Procedural generation in Minecraft.

Figure 5: Different particle effects for explosions.

that game states are synchronized in every device. The multiplayer setup will also integrate seamlessly with the time travel mechanics to offer unique multiplayer interactions and experiences.

2.3 Procedural Generation

Using seed-based procedural generation, we will generate scenarios with unique configurations at each gameplay. This method provides players with new unseen environments each session while ensuring playability with a set of predesigned rules that control randomness. This simple algorithm also allows for the scalability of the map generation. The seed value will allow players to replay specific map setups that they consider interesting and share them with other players, encouraging game replayability.

2.4 Explosions via Particle Simulation

We will pay special attention to visual dynamic effects from explosions. Each explosion will be generated using particle effects and based on parameters such as brightness, color, shape, or velocity, allowing for distinct patterns and range effects. The particle properties will be tied to different types of explosives and objects, allowing the player to associate the effects with the objects used and better visualize the game state.

2.5 Environment Change

To visually enhance the passage of time within a game session, we will incorporate environmental changes, such as shifting sunlight, moving shadows, or changes in lighting as cues for time progression. This element will act as a way finder, helping players to orient themselves in the temporal dimension while also improving immersion to reflect player decisions. These changes will be achieved through dynamic lighting adjustments based on the game's internal clock and scene configurations.

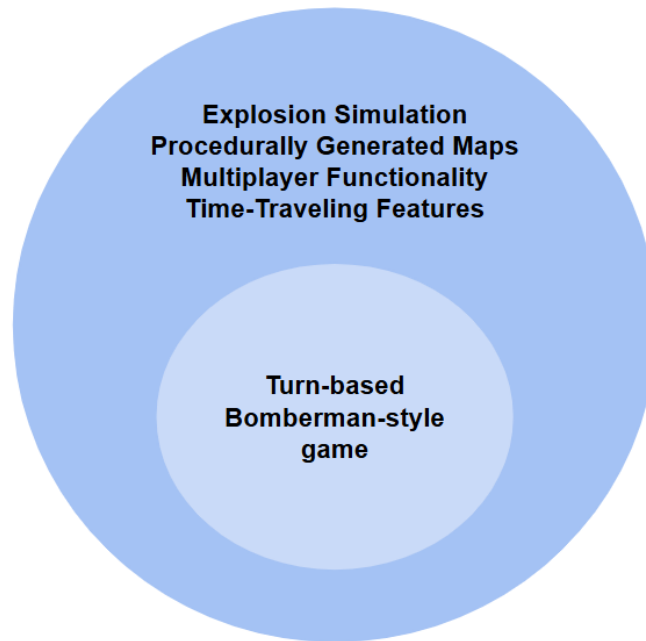

Figure 6: Change on shadows due to different solar azimuth.

3 "Big Idea" Bullseye

4 Development Schedule

4.1 Layered development Description

4.1.1 Functional minimum

Our minimum goal is to deliver a playable turn-based Bomberman-style game with simple default maps and limited interactive elements. The initial focus will be on core mechanics to ensure a functional foundation.

- Player movement and item placement logic.
- Basic environment objects.
- A fundamental weapon system that includes active and passive bombs.
- A basic resource system for initial resources and survival bonus.
- Essential assets.

4.1.2 Low target

At this stage, we aim to enhance gameplay mechanics and introduce additional features to create a richer experience.

- Time travel mechanics.
- Weapon system: sequentially unlocks more powerful bombs and special items.
- A basic GUI with menus and gameplay options.
- Assets specifically for special items.

4.1.3 Desirable target

Building on previous stages, we aim to create a more dynamic and engaging game environment.

- Procedural map generation to increase replayability.
- Local multiplayer for competitive play.
- Enrich interactive elements in environments.
- Assets and GUI for a better user experience.

4.1.4 High target

- Character personalization and animation.
- Multiplayer functionality across multiple machines.
- Additional game mode (e.g. round-based).
- Fine-tune numerical settings to balance gameplay and improve mechanics.

4.1.5 Extras

- Explore more interesting time travel feature possibilities and realtime gameplay.
- Online multiplayer gameplay.

4.2 Timeline

According to our layered development description and milestones in this semester, a initial time schedule is illustrated in Figure 11 and Figure 8.

Date	Milestone	Week	Layer	Task	Expect Hours	Actual Hours
Nov 06-12	Prototype	1	Prototype	physical Prototype	4 * 5	
			Minimum	simple assets	5	
				simple map & static object	5	
				player move & item place	5

Figure 8: Time schedule [2/2].

5 Assessment

The game will combine strategic decision-making with explosive chain reactions, creating a dynamic and suspenseful experience. The time travel feature will add a unique twist, allowing players to strategically undo their moves, heightening both strategic depth and unpredictability.

The game is designed for players who enjoy competitive strategy games, especially fans of Bomberman, turn-based tactics, and games with elements of mind games or puzzle-solving. Players seeking multiplayer experiences with strategic depth and unique gameplay mechanics are expected to be particularly drawn to this game.

In this game:

- Players place bombs with an option to activate their fuses. Activated bombs explode after a delay of a few turns, while unlit bombs remain dormant and can be triggered by chain reactions from other explosions.
- The time travel feature allows players to revert all players and the environment to their state from some turns ago. However, the last bomb each player placed before turning back time will remain and explode according to its original timing.

This gameplay will introduce both offensive and defensive layers, encouraging strategic bomb placement and reactionary tactics.

1. **Engagement and Replayability:** Players should feel compelled to play multiple rounds and experiment with new strategies, especially utilizing the time travel mechanic.

2. **Balanced Mechanics:** A successful design should make the time travel and bomb chain reactions feel fair, with strategy prioritized over luck.
3. **Strategic Depth:** Players should have opportunities to improve with experience, discovering advanced tactics and evolving their strategies.
4. **Player Retention:** The game's success can be measured by a strong player base with high retention, indicating enjoyment and multiplayer appeal.

Milestone 2: Game Prototype

6 Description

We create a physical prototype in a 2D board that fully reflects the gameplay functionality of our game. Initially we propose the following rules for playing the game:

1. The board is set arbitrarily to a 8x8 grid of tiles. The tiles will contain an unbreakable walls, breakable walls or be empty.
2. Every tile can be occupied by a single element at the same time.
3. The game is played via sequential turns as in chess. First a player decides and plays his actions, then the next player plays his turn until every player has completed their actions.
4. In his turn, a player can move up to 3 tiles horizontally and vertically in any possible trajectory. A player cannot move into a tile occupied by any other element or player. Additionally, in his turn, a player can place a single bomb in any of the tiles it has visited. Every bomb is either active or passive and this is decided by the player at the moment he places on the board.
5. Active bombs have attached a counter that begins at 3 when placed. At the beginning of the player who originally placed the bomb, the counter is decreased by 1. When the counter reaches 0 the bomb explodes. The explosion reaches all the horizontal and vertical tiles that are at a distance of 1 tile from the bomb and the tile the bomb is at. All other bombs that are in tiles affected by the explosion also explode causing a chain reaction that get resolved at that same moment. The breakable walls that are affected become empty tiles. The players in affected tiles are eliminated and lose the game.
6. Passive bombs do not have a counter but when affected by an explosion explode as an active bomb.
7. One breakable wall will have hidden an hourglass item. When the tile is affected by an explosion, the hidden item will appear on that tile. The first player that moves over the item will acquire it and the item will disappear the board. At the beginning of his turn, a player can use the item, which is consumed, to perform a time travel of 3 turns in the past to the beginning of that turn. When this happens the board is reset to the exact state it was 3 turns before with the exception of the bomb both players might have played in the turn before performing the time travel, which are also carried in the state they are to the new board.
8. The game ends when a single player is alive and all the other players have been eliminated.

7 Experience

7.1 Strategy and Interaction

Throughout our play sessions, we observed that players are motivated to explore and develop various strategies based on our interaction and mechanics. These mechanics distinguished our game from the traditional action game Bomberman, leaning more towards a strategy-driven experience. Rather than relying on quick reflexes, players are encouraged to plan, anticipate, and outmaneuver each other.

- **Timing with Bomb Detonations:** the combination of explosion range, movement step size, and bomb countdown encourages players to carefully time their moves. Planning ahead becomes essential, as players must anticipate both their own and their opponents' actions to avoid explosions and capitalize on positioning.
- **Early Bomb Triggering:** players tend to place bombs early in the game to remove breakable walls and expand the battlefield. This strategy creates a dynamic environment where players have more options and tactical opportunities.
- **Trap Setting:** an integral aspect of gameplay is players attempting to trap each other by strategically placing bombs. By predicting and limiting opponents' movement options, players can increase the likelihood of an opponent getting caught in an explosion, making for tense, engaging moments.
- **Chain Reactions:** to maximize impact and maintain safe positions, players frequently set up bomb chains that trigger successive explosions. This strategy allows them to target opponents from a distance, adding a rewarding level of risk management.

7.2 Weapons and Items

The integration of our core items—the active and passive bombs, as well as the hourglass for time travel—adds both depth and breadth to the strategic possibilities. Each item introduces new layers of decision-making.

- **Impact of Bomb Collision:** when bombs are placed with collision volumes, they can act as barriers, restricting movement options and enhancing the trapping mechanics. Players are motivated to use bombs as obstacles to manipulate opponent movement.
- **Hourglass to Travel Back:** the hourglass item brings a unique twist to gameplay. When used, it rewinds recent turns while keeping the player's last bomb in place. This mechanism allows for surprise strategies, such as reversing a near-loss situation or enhancing a bomb trap.

8 Revisions to Game Idea

By creating the prototype, we are able to play the game, spot the advantages and disadvantages of our proposed design, and make modifications to our design.

The basic winning strategy of classical Bomberman is trapping the enemies in the bombs' explosion region. Our game should also take it as the key to winning, in ways of placing the bombs as obstacles, creating chained explosions, and using time travels or other potential items.

- **Map Design:** the map design appears to be harder than expected. During our test plays on the prototype, we found adding the number of breakable walls can help increase the suspense of the possession of the time travel feature but at the same time increase the length of the game. The unbreakable walls should be of a larger number but not continuous in a large size, to provide enough possibility of trapping enemies and encourage the use of chain reactions simultaneously.
- **Numerical Design:** as expected, the numerical design is crucial to tuning the desired player behavior. For example, a small explosion range encourages more blocking opponents using bombs which is not what we want from a chain-reaction-centered game, while a large one also kills the value of cascaded

explosions because single explosions are already powerful enough. On a current 8x8 prototype map with max. 3 tiles movement and max. place 1 bomb per player each round, we tested and found the sweet point explosion range of 2 that can hopefully highlight the potential of chain reactions.

- **Game Mode:** we proposed the game as a turn-based one available for local multiplayer, which means one player has to wait for the others' turns to finish the round. In our tests on the prototype, we found it possible to allow simultaneous actions for all players within a round. To solve edge conditions, the bombs placed in one round take effect (block players and being triggered by other bombs) only after the next explosion calculation (i.e. the start of the next round). At the same time, local multiplayer will not be possible because the players should act at the same time and should not know the other player's action in the round.
- **Time Travel Feature:** the travel back feature has been proven to successfully deepen strategy depth and to be a powerful resource to compete for. It can be used as a redo to save the user's life when trapped, or as an aggressive item by taking advantage of the remained last bomb. However, players feel the consequence of using time travel on our paper-based prototype is unclear, which affects user experience. In our game development, we should provide previews of travel-back to the players.
- **Game Concept:** we are happy to find that all 4 members of our team feel it's fun to play with the prototype. Since we are different types of gamers, we are more confident in having the game attract a large range of players.

Milestone 3: Interim Demo

9 Task Progression

We have successfully completed all tasks within our minimum and low target objectives. We have focused mainly on the game logic and its functionality until now. For features in our desired target, we have made significant progress. The local multiplayer functionality is now fully implemented, allowing two players to share one keyboard (each using either the left or right half). Our game is now fully playable locally in a two-player mode on a single level, featuring active and passive bomb explosions, chained reaction mechanics, and time travel functionality.

Figure 11: Time schedule

10 Challenges

10.1 Input System: Keyboard Splitting

Implementing local multiplayer using Unity's modern input manager presented unexpected challenges. While the system is designed to simplify input handling, configuring two players to share a single keyboard proved non-trivial. The default player-joining behavior assigns players to separate devices, which conflicted with our keyboard-splitting setup.

To resolve this issue, we:

- Switched the player join behavior from automatic to manual, and manually join the players in Game-Manager.
- Assigned the same keyboard device to both players.
- Configured distinct key schemas for each player, ensuring that the shared keyboard functionality operates as intended.

10.2 Time Travel Feature: Snapshots and Current States

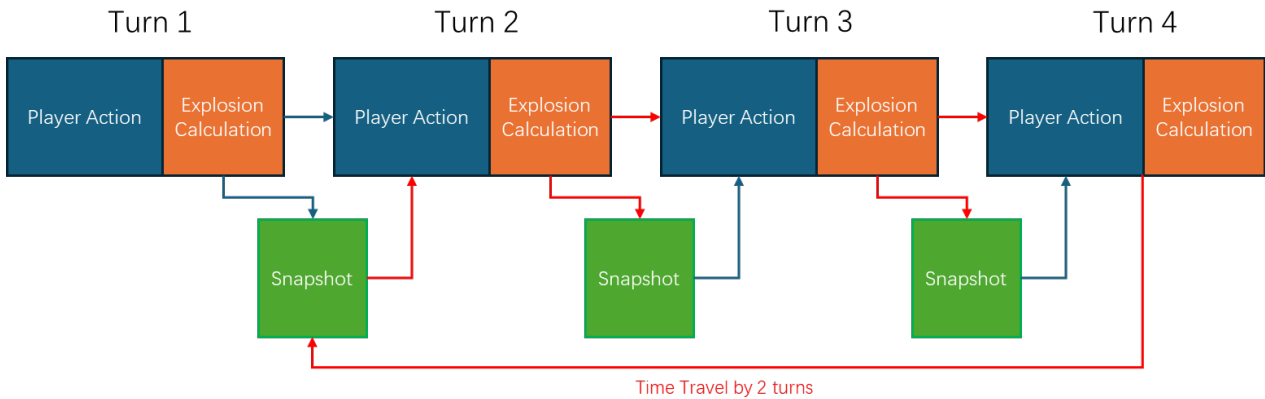

Figure 12: Overview of Time Travel Feature. The red arrows denote the pipeline of Time Travel.

The time travel feature requires taking snapshots of each round and properly rewinding to the related previous snapshots. So the main task of the time travel feature is separated into three subtasks:

- Definition of the data structure of snapshots.
- Taking the snapshots to save the current state.
- Loading snapshots to rewind to a previous state.

10.2.1 Data Structure Definition

Because the Player, Bomb, and Resource are Monobehavior classes, we need to define information classes as a record to take a copy of their current states, otherwise the information in snapshots will be changed due to reference. So we created PlayerData, BombData, and ResourceData classes to store their core data in the snapshots. The wall data is stored as a list of position, and the map items are in a list of GameObjects for convenient placing and enabling/disabling. To allow remaining the last bomb placed by each player, we recorded the last placed bomb in Player class and stored it in PlayerInfo class.

10.2.2 Taking Snapshots

At the end of every turn, a snapshot of the whole game state will be taken, by storing data to the defined data structure.

10.2.3 Loading Snapshots

When a player calls time travel, the current turn will not be taken into account and will rewind back to a previous state by loading a snapshot.

The Loading of snapshots contains player position placement, player resource management, map wall placement, map item recovery, past bomb and last bomb placement, bomb state (e.g. turns until explosion) loading, game manager state loading.

There are some edge conditions here that can bring up unexpected conditions, such as:

- Calling a 3-turn time travel in the 2nd turn.
- Time Travel back to a turn when the hourglass hasn't been picked up.

To deal with the issues, we:

- Revert to initialized state when calling an early time travel.
- Make the hourglass an exception in recovery, i.e. the hourglass is a one-time item.

10.3 Item Interaction

Until now we display the picked-up items in the game world such as hourglass, coins and the weapons in a UI panel. For the coins we use yellow sphere and for the hourglass we use a blue sphere for now. We have defined an Item class to demonstrate different existing item types that appear as in-game world items. The user picks up the items by collision detection with the items. The resource management system that we have implemented facilitates the storage of them in our inventory and is easily scalable.

We differentiate between stackable and unstack-able items. Items such as coins and various types of weapons are considered stackable. However, hourglass item is a unique and unstackable item, which the user can hold a use one time. This way there is a fair chance for all players to be able to pick up at least one hourglass per game, once it appears.

Items for now are placed manually by us, for further improvement we plan to design a respawn system of the in-world items. The respawn system has to be randomized but also calibrated with the generated map per level. Additionally, one further improvement will be creating a visual inventory to display the items as icons and reduce the amount of text displayed. This will improve the game experience for the players.

10.4 Chain Reaction

We implement the logic for placing active and passive bombs on the current player position. Active bombs have a counter that is decreased at the end of each turn. Once the counter reaches 0 the bomb explodes and affects the tiles in all 4 directions (up, left, down, right). We check for collisions with any object tracing a ray from the bomb position and retrieve the first hit object (if any). If the object lies within the bomb radius, then it will be affected in the following way: breakable walls will be broken, players will be eliminated and other bombs will explode. We add a small explosion animation at every affected tile to keep visual coherence and help the development testing.

To prevent any undesired behaviour we place every object center at round number positions and assume their position as the tiles for our game with a tile step of 1. This allows us to perform all the distance checks using the objects' positions directly and avoids the additional logic for a matrix based tile manager.

In order to maintain the logic proposed in our prototype, we want to perform all explosions at the same time, and afterwards compute the result on the breakable walls. This prevents some edge cases where the order of the bomb explosion changes the final result, e.g. propagating an explosion through a breakable wall after it has been affected by another bomb that same turn. We consider this specially important for obtaining a deterministic output from the same initial situation in a strategy game.

11 Design Revision

11.1 Scalability Considerations

During the implementation we learnt that it is important to focus on the scalability of the code to facilitate the extension of mechanisms, if needed. We have not made any design revision compared to our presented prototype up until now. Instead, we focused on not only achieving the current targets but also ensuring scalability for future versions. Below we focus on some of them:

- **Turn Mechanism:** instead of managing turns solely within a single game, we implemented a hierarchical structure that organizes gameplay into games, rounds, and turns. This approach eliminates the need for major refactoring when introducing a multiple-round setting, enabling seamless winner calculation and turn management adjustments.
- **Resource Management:** all user resources (including steps, coins, and time-travel items) are managed cohesively. This structure simplifies the addition of new items and facilitates future numeric or categorical extensions.
- **Input Handling:** by adopting Unity's event-driven input system, we ensured that our local multi-player requirements are met. This approach also lays a strong foundation for transitioning to remote multiplayer in the future.

Milestone 4: Alpha Release

13 Task Progression

Despite some pending numerical refinement decisions, we ensured all critical elements for the Alpha release were delivered, aligning well with the overall project timeline.

Tasks were not fully packed into the last two weeks before the Alpha release, showcasing how the period from 18th–24th December, reserved for bugfixes and delayed tasks, allowed the team to make up for missing assets and tackle several features beyond the original plan.

14 Challenges

14.1 Map Generation

One important factor that makes our game re-playable and interesting in each level is its map. For the first level of the game, we are using the same map as our prototype. This level serves as a tutorial level for new players to get familiar with the in-game mechanics. For other levels we are generating maps by procedural content generation to make each level unique and special. For the map generation we are using the Random Walk Algorithm [1]. After thorough research it was concluded that this algorithm with some minor adjustments can fit best to our needs.

14.1.1 Random Walker Generator

Our map has accessible (tunnels) and inaccessible areas (walls) and the players can navigate through a connected route. Initially we generate a map with the given dimensions that contains only unbreakable walls. Then we place the 'Walker' in a random position on the map and replace the unbreakable wall with a floor and we 'dig' tunnels. We dig tunnels by choosing a random length from maximum allowed length and a random direction (up, down, right, left) and finally drawing a tunnel in that direction and length. The algorithm keeps digging tunnels, making random turns with random length, updating the walker's position until the desired number of tunnels are satisfied.

The generated map until now includes a route for the walker to navigate inside a maze of unbreakable walls. Therefore we have to adapt it to our needs. Firstly, we wanted to place the players in the corners for the start of the game. Since the generated map can also include unbreakable walls on the corners, we had to set a flag for the desired map that we would accept. We keep generating the map and only accept the one that has corners free, meaning floors are places on each corner, so we can place players on the corners. Since this could end in an endless loop if the maximum tunnel is too low, we have also set the maximum attempts to try. By various trials and adjustments of the numerical values of maximum tunnel and maximum length we found out the best combinations that provides us a fast and well-suited generated map for our needs and not making the game crash.

14.1.2 Breakable Walls and Items

Since our game should consist of breakable and unbreakable walls, we had to add extra constraints to the generated map even further. For placing the breakable wall, we decided to replace the floors with breakable walls, since technically the players can also walk through the path of the breakable walls after they are broken. We start with a starting probability for the breakable wall and a random number. If the random number is more than the starting probability we increase its value. Otherwise we replace the floor with a breakable wall and reset the starting probability. For placing items (coins and boots) on the map, we also use the same logic. We don't differentiate between item types here yet. while instantiating the items we choose a random number generator to either instantiate a boot or a coin on the map. Therefore, it can happen that the number of generated coins and boots do not match, or items of one type only will be generated. While this outcome may not be optimal, the players learn to play strategically with the available resources on the map.

After placing breakable walls and items, we clear the corners so there is enough room for the first movement of the players, for placing bombs without being affected by it. Finally, we add border to our map for nicer visual appealing. For placing the borders we create another map with dimension + 2 full of borders, and copy our generated map into it.

The only missing item is now placing the hourglass under one breakable wall. For this we loop through our final generated map and create a list of breakable walls and we return the position of a randomly chosen breakable wall. We then instantiate the hourglass under the chosen breakable wall.

Figure 18: Examples of the generated map

The challenges we faced for the map generation was mostly in regard of making the map look as we desired with an existing algorithm. The random walk algorithm gave us a good basis and by adding some constraints we adapted the generated map until we finally met our desired goal.

14.2 Audio and Visual Elements

For the audio sounds and visual aspects of the game we used materials from the unity asset store, sketchfab, and pixabay websites. We had envisioned a world where the players are robots and fight between them takes place in space. With this vision, we tried to find assets that fits our needs. For UI icons we also used generated AI to create new icons was used for our inventory system for instance.

For the players we used Sci-Fi Ball Robot asset [2]. For the breakable walls we used Cartoon Crate Collection [3] and for unbreakable walls and floor we used Yughues Free Metal Materials [4]. The boot [5], coin [6] and border [7] 3D models were found in Sketchfab. The bombs and hourglass 3D models were used from Props 3D [8] and the skybox from Diverse Space Skybox asset [9] in unity assets store.

For the music we chose arcade-vibe style. This not only matches the original nostalgic vibe of the original Bomberman game, it also adds the originality flavor to the game. All sounds effects for bomb explosion [10], coin pickup [11], boot pickup [12], hourglass pickup [13], and background music for levels [14] [15], main menu [16], gameover menu [17] were found from pixabay website. We implemented an audio mixer so that the player can adjust the volume for effects and background music according to their preference. A full list of resources used assets and audio tracks can be found in the bibliography section.

14.3 Time Travel Preview

To provide the hourglass holder with an idea about the effect of using time travel in the current turn, we have introduced time travel preview in Alpha Release, as shown in 19.

Figure 19: Time Travel Preview.

The appearance of the preview panel is half-transparent for a better see-through between current states and potential time travel results. To avoid blocking, the viewing angle is perpendicular to the floor plane. The time travel preview allows easier decisions on the usage of time travel, and contributes to deepening decision depth.

To implement this feature, we first planned to create a duplicated scene of the whole game, perform time travel on the copied scene, and display the rewind scene in a small window as the preview. But the plan has been proved to be sub-optimal, due to:

- High performance cost. Duplication of all objects and rendering simultaneously takes significantly higher memory and computation power.
- Difficulties in development. Many scripts define `Monobehavior`, which requires manual deep copies to make sure the duplication doesn't affect the current state. This is not recommended in Unity development standards.
- Invisible bombs. If one last bomb is planted at a location where a breakable wall is restored after time travel, the bomb will be invisible to the player as it's hidden in the wall.

As a solution, we finally implemented time travel preview by combining snapshot images and last bomb rendering results. Every time a snapshot is saved, an extra screenshot of the state will be taken and saved as texture in the snapshot. When a time travel preview is requested (by hovering the pointer on the hourglass button), another screenshot containing only the current last bombs is taken. By combining the last bomb image and the screenshot in the target snapshot, we can get the preview image with past map states and current last bombs. This method is flexible to further changes to the the game features and minimizes the memory and computational costs, but brings up frame rate jitter when calling the review, due to the real-time rendering of last bombs.

14.4 Explosion Visual Effects

To enhance the explosion effects and enrich the game with new featured bombs, the explosion effects system was upgraded with various new visual and audio effects. The goal was to improve the player's experience and clearly differentiate bomb types. The following new features were introduced:

1. **Decay Management:** An `ExplosionManager` was introduced to handle all visual and audio effects with proper timing, synchronization, and scalability. Using `Coroutine`, we ensure asynchronous operations can manage multiple explosions simultaneously following the trigger delay.
2. **Visual Effect Refinement:** Each bomb's visual and audio effects are now managed independently within the explosion `MonoBehaviour`. Specific tuning of visual effects was achieved programmatically. For instance, the flame color of the `SafeBomb` was visually distinguished to reduce user confusion (indicating it only damages walls and not players). Additionally, a decay effect was implemented for flames, causing the visual intensity to diminish with distance from the explosion center, enhancing realism and user experience.

15 Design Revision

15.1 Cascaded Explosion Refinement

The explosion system faced significant issues when managing the cascaded effects, especially regarding bomb triggers and delays. The following key challenges were identified and addressed:

- The order of bomb triggers was not well-defined; adding delays caused deviations from expected behavior.
- Features like the `Chainbomb`, which powers up bombs it triggers, did not function as intended due to limitations in the trigger order.
- Adding new bomb features, such as the `SafeBomb`, was challenging due to the lack of proper layer management for cascaded triggers.

To address these challenges, we implemented the following refactorings:

1. **Decoupling Explosion from Bomb:** The trigger decision and cascaded effects on players and walls are now handled by the bomb. Explosion-specific details, such as delay, range, and visual effects, are managed independently by the explosion system.

2. **Refactoring Explosion Calculation:** The mechanism for handling triggers within the current turn and their cascaded effects was restructured from a Depth-First Search (DFS) to a Breadth-First Search (BFS) approach. A trigger queue was introduced, ensuring triggers are processed from early to late, and delays are handled in ascending order. This satisfies the functional requirements for features like `Chainbomb`.
3. **Implementing Triggering with Layers:** The cascaded triggering of surrounding objects with ray-casting was configured using the layer system in Unity. Previously, players could occlude rays, preventing them from detecting walls behind. By configuring all entities (walls, players, bombs) with appropriate layers, calculations became manageable, and features like the `SafeBomb` (which damages walls but not players) were effectively integrated.

15.2 Other Refactorings

- **Bomb Mechanism Adjustment:** To simplify the gameplay and highlight decisions, the bombs placed in the current turn will take effect instantly, instead of earlier planned starting from the next turn.
- **Consistent Resource Management:** Items picked up by players are now managed as a total resource count, rather than by maintaining object references in the inventory list. This enhances compacity and reduces complexity especially for time travel.
- **Centralized Bomb Configuration:** Each bomb type now has a centralized `BombConfig` that handles its properties and appearance. This approach makes numerical adjustments easier, facilitates the addition of new bomb types, and ensures consistent handling of bomb features across the game.
- **Map Generation:** The initial version of the Random Walker Generator used numerical values in various functions to distinguish between floors, breakable walls, and unbreakable walls. For instance 0 for the floor, and 1 for unbreakable wall. While this approach was initially straightforward, it became difficult to follow as map generation constraints grew more complex. To address this, we refactored the code by defining constants for map generation. These constants are now used to represent floors, walls, borders, and items, making the code more readable and maintainable. Adding new elements is now as simple as defining a new constant.
- **Item Placement:** Our map contains two primary items: coins and boots. Additionally, we have a special item, the hourglass, which is placed randomly under a single breakable wall. Initially we were differentiating between primary item types, creating respective functions for placing coins and boots separately. To ensure scalability, we refactored the code so that adding a new primary item type is as simple as instantiating it. The refactoring process eliminated the need to differentiate between item types (e.g., coins and boots). We randomly choose from a pool of defined items and instantiate the item type in the designated item placement position. This approach allows any newly added item to be seamlessly integrated and randomly generated on the map.

Milestone 5: Playtesting

16 Playtesting Description

We conducted a one-day play testing session in the hall of the Mathematics and Informatics building in Garching, aiming to recruit participants from the general public. Also we invited several family members or friends to test our game at home. Each playtesting session lasted approximately 20 minutes. Participants were first asked to sign a consent form, after which they played our game for 10-15 minutes. Following gameplay, they spent 5 minutes grading the game via a Google Form and answering four open-ended questions about their impressions and suggestions. The specific questions included in the Google Form, along with the consent form, are provided below.

16.1 Playtesting Overview

As our alpha release version is a local multiplayer game designed for two competitive players, the playtesting sessions not only revealed moments where players had questions or encountered difficulties but also showcased how they communicated with each other. This communication included discussing game operations, sharing feedback on the design, and making strategies to outplay one another. Observing these interactions provided invaluable insights into the player experience and gameplay dynamics. If playtesters were in groups, they were arranged to play against each other, otherwise one of us played as the playtester's opponent.

To observe the players' first-touch and slightly experienced behavior, we designed the playtesting as a two-round gameplay. Players first play in a pre-designed map where we can make sure players are exposed to core game features. Then in the next round, a generated map will be used to provide diversity of experiences and allows us to observe player's actions when they are aware of the core gameplay mechanisms.

16.2 Question List

We tried to get a general background information from our players with our questions, in order to categorize them better and have more details of how well suited our game is for various group of people. In our question list we asked about their relationship to the developers (friend, family, stranger), their gender and their age. Additionally, we asked how often they play video games (daily, a few times a week, occasionally, rarely) and what type of games do they usually play (action/adventure, role-playing games, sports/simulation, strategy/puzzle, multiplayer/competitive) and if they have ever played Bomberman or other similar games. After gathering this information, we asked for their general feedback about our game. For this purpose following questions were asked:

1. How would you describe your overall experience playing the game?
 - (a) Engaging
 - (b) Challenging
 - (c) Frustrating
 - (d) Rewarding
2. Was the game concept of "Chain Reaction" clear to you?
 - (a) Not clear at all
 - (b) Somewhat unclear
 - (c) Neutral
 - (d) Fairly clear

- (e) Very clear
3. Do you think understanding "Chain Reaction" is important to winning the game?
 - (a) Yes, it's essential to winning.
 - (b) It's somewhat important but not critical.
 - (c) No, I didn't feel it was necessary to win.
 4. What could make the "Chain Reaction" concept clearer to you?

For getting feedback on gameplay mechanics, experience and difficulty we asked them several question to measure how well the mechanics and the experience is defined for each player. The players were asked to rate their agreement using the following scale: Strongly Agree, Agree, Neutral, Disagree, and Strongly Disagree. For this section following questions were asked:

1. The gameplay mechanics are easy to understand for me.
2. I know the function of different kinds of bombs and I'm encouraged to use them
3. The controlling methods are intuitive and easy to use
4. The game is balanced in different kinds of bombs and competition of items
5. The rounds provided an appropriate challenge.
6. The game feels balanced when playing against other players.
7. How would you rate the performance (frame rates, input lag) of this game?

Finally, we asked the players some open question as well, since we thought such questions are better answers in person than with a Google Form. For this questions, first we asked each player to plot our game in the play matrix. Then we asked the what their favorite and least favorite aspect of the game was. We asked what changes or additions they would like to see in the future updates. During the gameplays we also observed each player to see if they encountered any unexpected behaviors or bugs that we can fix for the final release.

16.3 Consent Form

We asked each player to sign the following consent form for gameplay testing participants of Rebomb. We only recorded the video of their gameplays and audio to capture their reactions during the gameplay for our analysis. The consent form can be found in the Google document link here.

17 Result Analysis

17.1 Player Information

In the first part of our questionnaire, we focused on gathering information to better understand the profile, preferences, gaming habits and their favorite genres. This helps us make analysis and improve the gaming experience based on their unique characteristics. Our playtesters were primarily strangers, potentially ensuring unbiased feedback. They were primarily young males aged between 18-34.

Relationship to the developers
12 responses

(a) Relationship to developers

Gender
12 responses

(b) Gender

Age
12 responses

(c) Age

The majority of the playtesters are active gamers, with over 50 percent playing daily or several times a week. Multiplayer/Competitive games dominate the preferences, while action/adventure games are not very popular among them. Interest in Bomberman or similar games is evenly distributed, with no one completed uninterested. Most playtesters are familiar with either Bomberman or similar games, which has a potential for engaging this audience further.

How often do you play video games?
12 responses

(a) Player type: playtime frequency

What type of video games do you usually play?
12 responses

(b) Player type: game genre

Have you played Bomberman or other similar games?
12 responses

(c) Familiarity with the original Bomberman game

17.2 Game Impressions

17.2.1 General Feedback

From the general feedback we got, we learnt that the game is both fun and challenging for most players. This was a nice achievement for us as developers. Watching their gameplay, allowed us to observe their interactions, highlighting the levels of fun and competitiveness they experienced during gameplay. Smaller portion found it frustrating as well. We asked them about the reason of their frustration, and they explained us it was due lack of tutorials related to game mechanics and various bomb types. So we learnt that improving tutorials or balancing difficulty could improve the overall experience.

While the concept of "Chain Reaction" is somewhat clear to many respondents, there's room for improvement in explaining the mechanics. Over 33 percent found it unclear, indicating a need for better tutorials or instructions. A majority believe understanding the game concept is critical for success, which aligns with the need for clearer explanations or tutorials for the "Chain Reaction" concept.

How would you describe your overall experience playing the game?
12 responses

(a) Overall experience

Was the game concept of "Chain Reaction" clear to you?
12 responses

(b) Concept of Chain Reaction

Do you think understanding "Chain Reaction" is important to winning the game?
12 responses

(c) Importance of Chain Reaction

17.2.2 Gameplay Mechanics

A majority (83.3 percent) agree that the gameplay mechanics are easy to understand. While most respondents understand the function of different bombs and feel encouraged to use them, a significant portion (41.7 percent) is neutral or disagrees. Improved tutorials or clearer descriptions of bomb functions can help. A large majority (83.4 percent) find the controls intuitive and easy to use. However, there's a small group (8.3 percent) that disagrees, suggesting possible refinements to control schemes. As we also witnessed the players and their struggles of playing on the same keyboard, we have though of redesigning key mechanics to controllers. The balance in bomb types and item competition is positively received, though more numerical refinement can address the neutral feedback as well.

The gameplay mechanics are easy to understand for me.
12 responses

I know the function of different kinds of bombs and I'm encouraged to use them
12 responses

Figure 24: Functions of different bombs

The controlling methods are intuitive and easy to use
12 responses

Figure 25: Intuitiveness of controls

The game is balanced in different kinds of bombs and competition of items
12 responses

Figure 26: Balance of different bomb kinds

17.2.3 Experience and Difficulty

A majority (66.7 percent) agree that the rounds are appropriately challenging. However, a significant portion (33.3 percent) remains neutral, suggesting that while the difficulty is acceptable, it may not stand out as particularly engaging or challenging for all players. Most players (83.4 percent) feel the game is balanced during multiplayer gameplay, indicating a well-tuned competitive environment. This indicates that multiplayer balance is a strong point, with the majority agreeing that the game is fair and competitive. However, the small neutral portion might reflect room for minor balancing adjustments. All respondents rate the game's performance positively, with 100 percent choosing "Good" or "Excellent." This indicates the game runs smoothly, with no major technical issues affecting gameplay.

The rounds provided an appropriate challenge.
12 responses

(a) Overall challenge of rounds

The game feels balanced when playing against other players.
12 responses

(b) Balance of the competitiveness

How would you rate the performance (frame rates, input lag) of this game?
12 responses

(c) Performance of the game

17.3 Open Questions

In addition to the Google Form we also asked the player the following open questions:

- What could make the "Chain Reaction" concept clearer to you?

The response to this question was mostly providing more details and information via interactive tutorials and additionally triggering or empowering the bombs more with chain reactions.

- What was your favorite aspect of the game?

Our playtesters really enjoyed the graphics, audio effects and music of the game. Their favorite was the multiplayer and competitiveness, strategic thinking of how and where to place bombs, the idea of turned-based while still being real-time in each round aspect of it and the uniqueness that the hourglass and time travel adds to the game mechanics.

- What was your least favorite aspect of the game?

The least favorite aspects of the game included unclear bomb countdowns, the inconvenience of using a mouse for the Ready button, frustration with the turn-based system requiring resets and waiting, and confusion caused by the variety of bomb types for new players.

- What changes or additions would you like to see in the future updates?

Suggested changes for future updates included adding bomb countdown labels and icons in help panels, reducing coins per turn while increasing steps, simplifying bomb varieties, improving player readiness and wait times, adding tutorials for bomb types and the time-travel feature, and enabling more players with bigger maps for a fun LAN experience.

For our final question, we asked the players if they encountered any unexpected behavior or bugs. Their feedback has been documented and included in our planned changes section.

17.4 Play Matrix

Finally, we also kindly asked them to plot our game in the play matrix. The purpose of this matrix was to categorize our game, and help us identify the primary elements of our game. It helps us to evaluate the

balance of skill, chance, mental challenge and physical requirement of the design and additionally identify the target audience based on it. As a result of our play matrix, we learned that our game for the playtesters leans more towards skill and mental calculation section, which was our initial intention while developing the game as well. This means that we have successfully managed to fulfill our initial goal, developing a game that requires skill and strategy for winning, and adding the elements of competitiveness and fun to it.

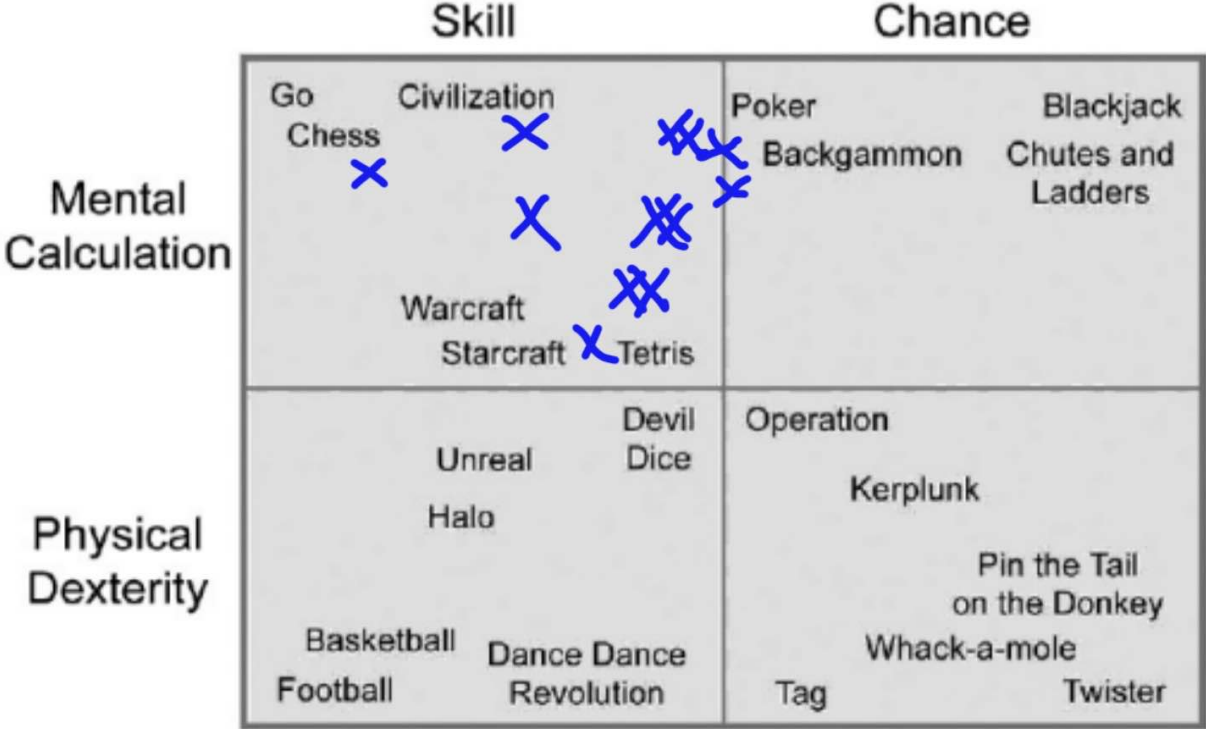

Figure 28: Player Matrix

17.5 Design Suggestions

18 Game Revision

This section outlines the changes identified concerning the result of our playtesting. We prioritized and categorized those already implemented, those planned to be done before our final release, and potential improvements considered nice-to-have but not scheduled.

18.1 Implemented Changes

- Bugfix: Resolved the issue where the time travel panel preview was blank.
- Updated appearance of bombs to differentiate ChainBomb and Safebomb.

18.2 Planned Changes

- Bugfix: Bombs from the previous round continue to appear in new rounds.
- Bugfix: where two players killed simultaneously at the same position shows only one winner.
- **Input Support:** Add input support using controllers and keyboards.

- **Tutorial:** Transition from text-based tutorials to video tutorials.
- **Turn Mechanical Enhancements:**
 - Increase the visibility and interactivity of the finish button (e.g., larger, shining, similar to Civilization’s UI style).
 - Add an animated turn-changing sequence with a prominent ”Turn X Starts!” message.
 - Implement a pop-up message prompting players to press F/J if no operation is detected (tentative).
 - Implement a countdown number display on bombs to provide players with clearer feedback on time to explosion(tentative).
- **Numerical Adjustments:**
 - Adjust the value of boots: each boot adds +1 step per turn, with a maximum of 2 boots per round.
 - reducing the cost of safe bombs to encourage using them (tentative).
- **Game Result Presentation:**
 - Replace text-based ”Player 1/2” labels with ”Player Blue/Gold” or icon of players.
 - Make the winner panel less opaque to show the explosions killing players better.
 - Include winning animations to celebrate the winners.

18.3 Nice-to-Have Improvements

- **Tutorial Round:** Introduce guided pop-up messages in the first few turns:
 - Highlight tile navigation with prompts like ”Press WASD/Arrow to move to this place.”
 - Show steps like ”Pick up the nearest boot” and explain its effect: ”Now you have 1 more step per turn.”
 - Guide bomb placement with instructions: ”Press 2/8 to place a passive bomb here” and ”Press 1/7 to place an active bomb here,” culminating in a demonstration of chain reactions.
 - Provide more guidance on different types of bombs.
- Add support for remote multiplayer.
- Introduce wall explosion animations for enhanced visual effects.
- Introduce a progressive unlock system for **SafeBomb** and **ChainBomb**, making them available in later rounds to avoid overwhelming the new players.

19 Lesson Learned

- Guidance significantly affects new players’ experience, especially for a strategy game that has a steep learning curve. We are supposed to improve tutorials and control methods to help players better familiarize themselves with the game.
- Playtesters with less video game experience report difficulties in understanding the simultaneously controlled turn-based mechanism. We need to explain better in tutorials and give more hints in the UI.
- We have received recommendations on numerical design. E.g. reduce the number of coins per turn.
- Due to playtesters’ mental overload on core rules and bomb types, the Hourglass hasn’t been frequently used by playtesters. But when playing against testers, we have found the Hourglass can act as a powerful gamechanger while still not overpowered as we wished. We plan to invite playtesters for longer test time lengths to explore more opinions on the Hourglass.

Milestone 6: Final Release and Conclusion

20 Game Summary

Rebomb is a two-player multiplayer strategy turned-based video game. The objective of this game is to use your resources wisely and try to eliminate the other player strategically. This can be achieved by placing bombs close to them. In each turn, the player has resources such as coins or boots. Coins are the currency used for placing bombs and boots are the amount of steps the player can take in each turn. Coins and boots reset at the beginning of each turn, they can also be picked up in the game to increase resources.

Our game consists of four different types of bombs. Active bomb costs 1 coin and explodes after 3 turns. Passive bomb costs 1 coin and explodes only when triggered by another bomb. Chain bomb costs 2 coins and explodes in 3 turns and increases triggered bombs' range by +1. Safe bomb costs 2 coins and explodes in 3 turns, does not harm the player who placed it, but can trigger other bombs or destroy walls.

Our game also consists of a special item, the hourglass. Hourglass is a one-time-use special item, which is hidden under a breakable wall. With this item, the player can travel back in time by 2 rounds. The players are encouraged to place bombs close to the breakable walls to find the hourglass and use it to their own advantage. After obtaining it, hovering over the hourglass icon shows the state of the map in 2 rounds before. With the time travel mechanism, the players can undo moves, replay turns, or trap enemies with the hourglass. The first round of the game is designed as a tutorial level. In this level the map is static. We used the same map from our prototype to implement and test our original ideas. After the players successfully finish the first level, the maps get procedurally generated. Each map is different, with the hourglass hidden randomly under a breakable wall, and other items such as coins and boots generating randomly. This eliminates the risk of repetitiveness in the game. At this stage, our game has 5 rounds.

The most significant change from the alpha release is that our game now in addition to keyboard, also supports controller inputs. We learned in our playtesting sessions that the keyboard keys are too close to each other and can get confusing for the players.

Additionally, we improved the tutorials significantly. We learned that tutorial plays an essential key for new players of new games and a lack of good tutorial can lead to frustration and lack of ambition for playing the game easily. Therefore, we focused on improving the original text-based tutorial that we had, and now we guide the player step by step for each basic input and wait for their following actions before moving to the next tutorial step.

Finally, we improved some existing features, such as the hourglass, by adding an icon and sound effects when the hourglass is in use.

We now also display the beginning of each turn to guide the player when a turn has finished and the next one starts.

Additionally, we have added number labels to bombs, indicating how many turns it will explode.

We fixed the existing bugs and did numerical refinements based on the feedback we received from the playtesting session.

21 Commentary

1. What was the biggest technical difficulty during the project?

One problem with turn-based games is that players inevitably have to click ready and wait for others. We have used various ideas to strengthen the turn-based system, ensuring that players can pay attention to the countdown of bombs, the update of resource quantity, and remember to press the ready button after the operation is completed. Although there are many classic turn-based games, such as Civilization 6,

that can be used as references, it is still complicated to eliminate the UI design changes that make players wait in turn-based games.

2. What was your impression of working with the theme?

The "Chain Reaction" theme served as an inspirational catalyst. During brainstorming, it generated core mechanics like cascaded bomb explosions, turn-based resource doubling, and late-game power unlocks. Though we ultimately focused on perfecting a single core mechanic: the cascaded explosion in a turn-based Bomberman game, the theme guided our design evolution through constant reference to chain effect principles.

3. Do you think the theme enhanced your game, or would you have been happier with total freedom?

The theme absolutely enhanced development. It provided a strategic focus that prevented decision paralysis while allowing creative interpretation. Players benefit from the thematic context that subtly guides strategy without revealing mechanical spoilers - the perfect balance between guidance and discovery.

4. What would you do differently in your next game project?

While our current 2.5D local multiplayer proved effective, I'd explore 3D sandbox environments next. This would allow simultaneous developer/player perspective experimentation, creating emergent gameplay through physics-based interactions in persistent worlds.

5. What was your greatest success during the project?

We successfully managed to deliver a fun, playable, and exciting multiplayer game, with the essential and desirable features that we aimed for. We delivered time travel mechanism to add uniqueness to our game, improved chain reaction for the bombs to make the explosions more enticing, and procedurally generated maps to make each level exciting. Instead of introducing remote multiplayer, we instead focused on improving the overall game experience for the players based on the feedback that we got from our playtesting session.

6. Are you happy with the final result of your project?

Yes. We are very happy with the final result of our project. We loved the improvements of the game after each feature implementation, and how it all worked together in the final version.

7. Do you consider the project a success?

Yes, we consider the project a success, especially after seeing our playtesters enjoy playing the game, as much as we did making it. It was a very great feedback to receive from their reactions as well.

8. To what extent did you meet your project plan and milestones (not at all, partly, mostly, always)?

The layered design of the game and the milestone set a great deadline for us to be on time with our deliveries. The three of us were always on time with the delivery of features that we chose to implement. We managed to have a fully playable alpha version already before the Christmas holidays. After that, we improved the game experience based on the feedback we got and fixed the existing bugs. Timeline could be found in Figure 29.

9. What improvements would you suggest for the course organization?

More than our early-stage design peer-review, we could have mid-term playtest other team's games. This might provide perspective from other game developers and learn from their experience.
