

# Leibniz Supercomputing Centre of the Bavarian Academy of Sciences and Humanities

## Roadmap for today

#### Part 1

- Basic concepts
- Definitions
- Containers vs. the world
- Hands-on #1: Kicktart: Your first steps with containers

#### Part 2

- Docker, volumes, ports, variables, and Dockerfile
- Containers for High Performance Computing
- Hands-on #2: Deep Learning: Make an ANN dream in a container
- Hands-on #3 HPC AI: Speech to text with OpenAI whisper

#### Part 3

- Abstraction
- Hardware acceleration,
- Scaling across a compute cluster
- Hands-on #4: Reproducible scientific workflow with containers: RNA-seq pipeline

#### **Agenda**

## What you will need

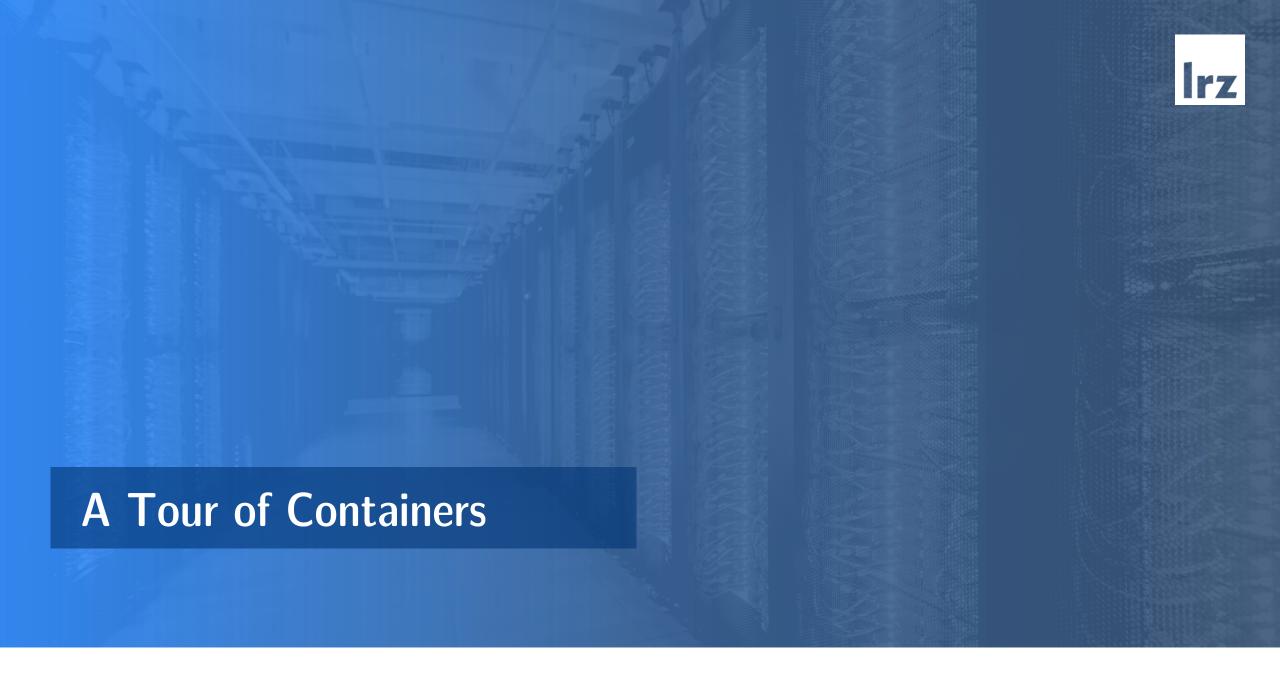

The course resources: <a href="https://doku.lrz.de/x/eQBvB">https://doku.lrz.de/x/eQBvB</a>

The exercises: <a href="https://github.com/LRZ-BADW/AITS-containers.git">https://github.com/LRZ-BADW/AITS-containers.git</a>

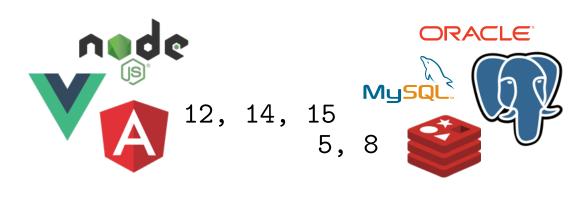

An individual Virtual Machine (sandbox), look in your emails:

- Your IP address: 138.\*\*\*.\*\*\*
- Username: hlrbkurs\*\*
- Password: \*\*\*\*\*\*
- > Option 1 (easy): You can access the IDE http://<138.\*\*\*.\*\*\*\*:8080/?folder=/home/<hlrbkurs\*\*>/training/
- > Option 2 (advanced): You can start SSH into the VM. Make yourself at home!

  ssh <hlrbkurs\*\*>@<138.\*\*\*.\*\*\*>

## **Kickstarter**

.gradle

.r

.cache

.conda

8, 11, 16

2.3, 2.4, 2.5

.npm

.jupyter

.node\_modules 13, 12

5, 7

2, 3, 4, 5

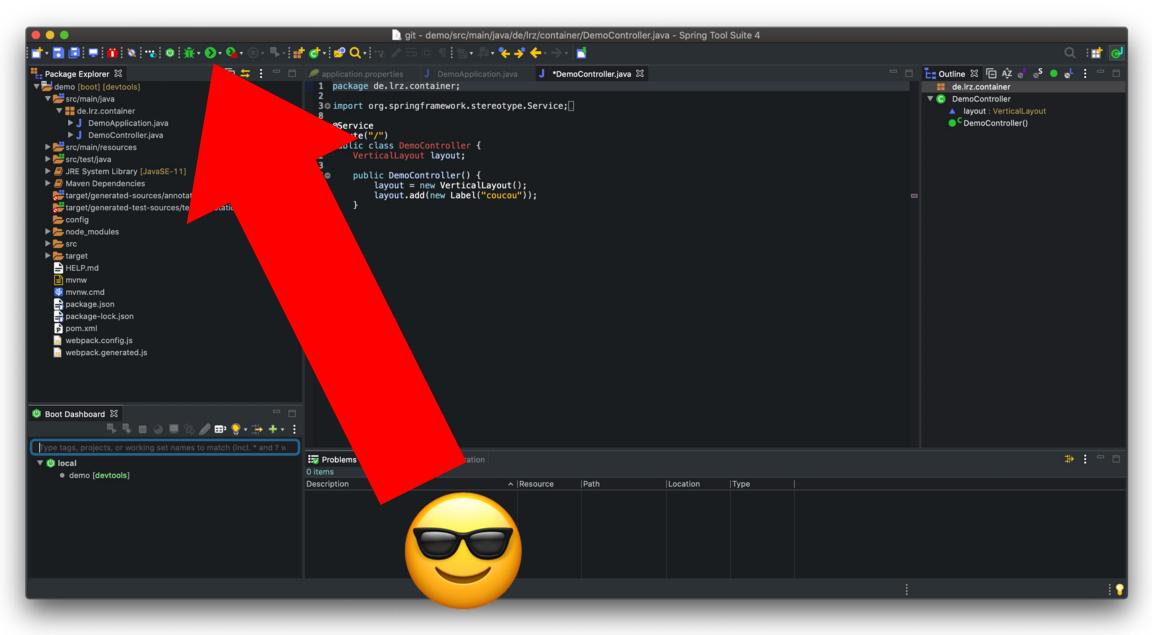

.config

/etc

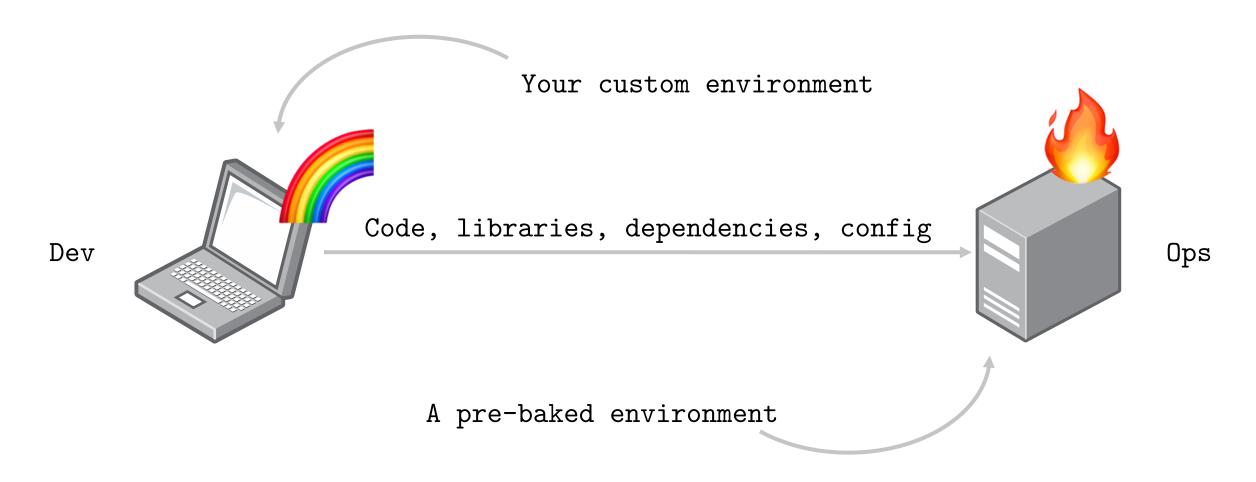

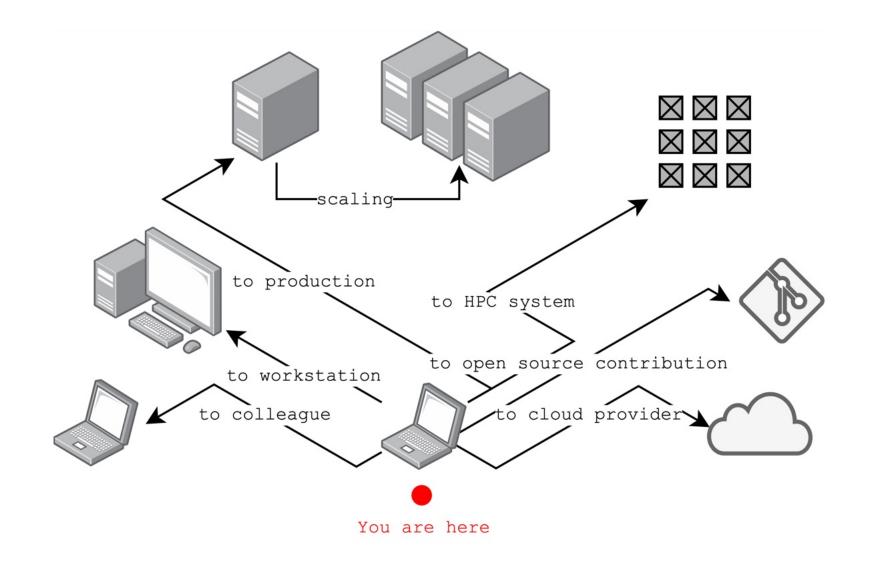

## Shpping software is dangerous...

## ... and yet it happens all the time

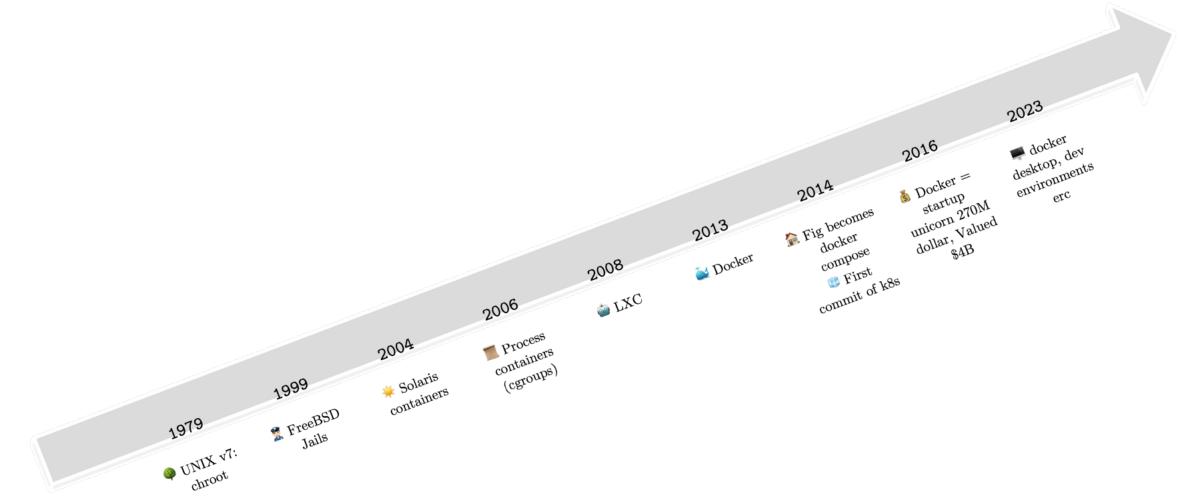

## The future of Linux containers (15th March 2023)

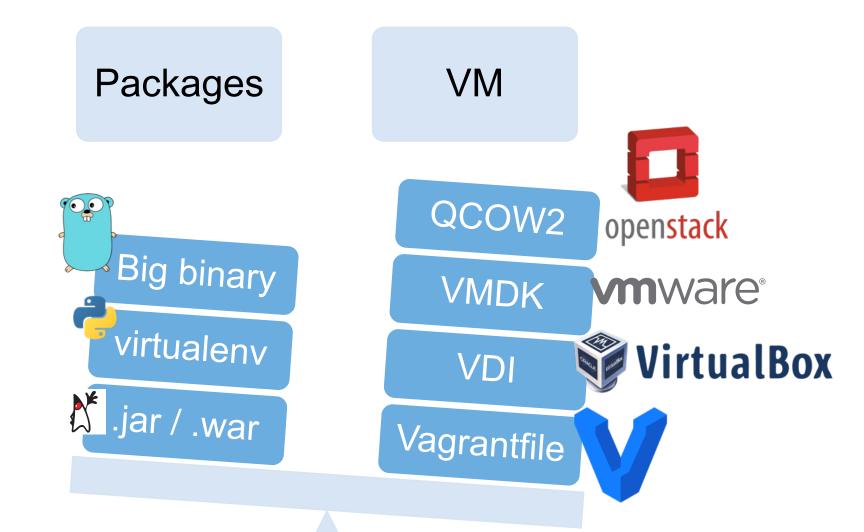

## **Timeline of Event**

## Landscape of solutions at your disposal when shipping code

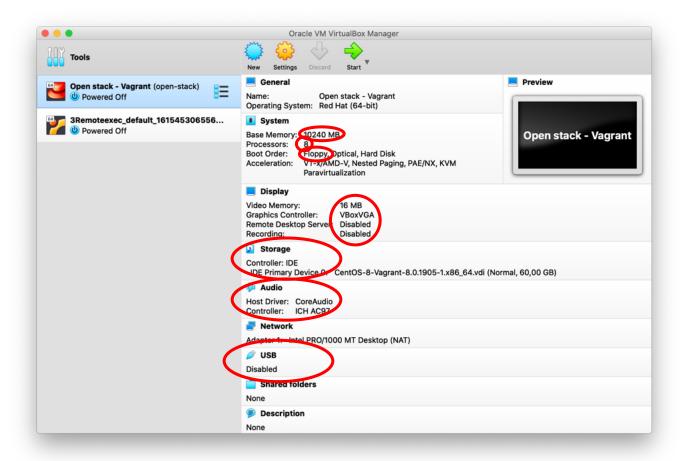

## Containers vs. VMs

#### VMs Emulate Hardware

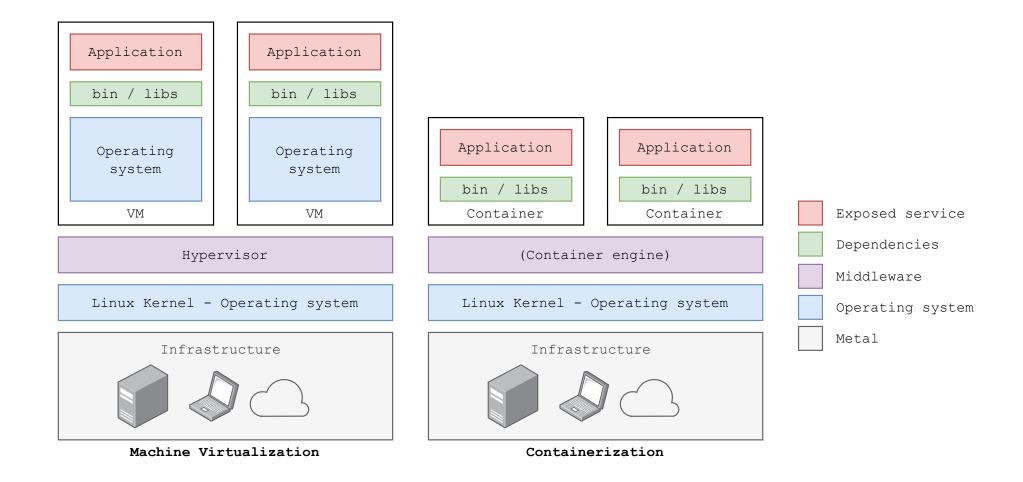

- RAM
- Processor
- Floppy drive?
- Graphics card
- Storage
- Audio card
- Networking
- Bunch of interfaces

**№** WAIT! we don't want to worry about hardware!

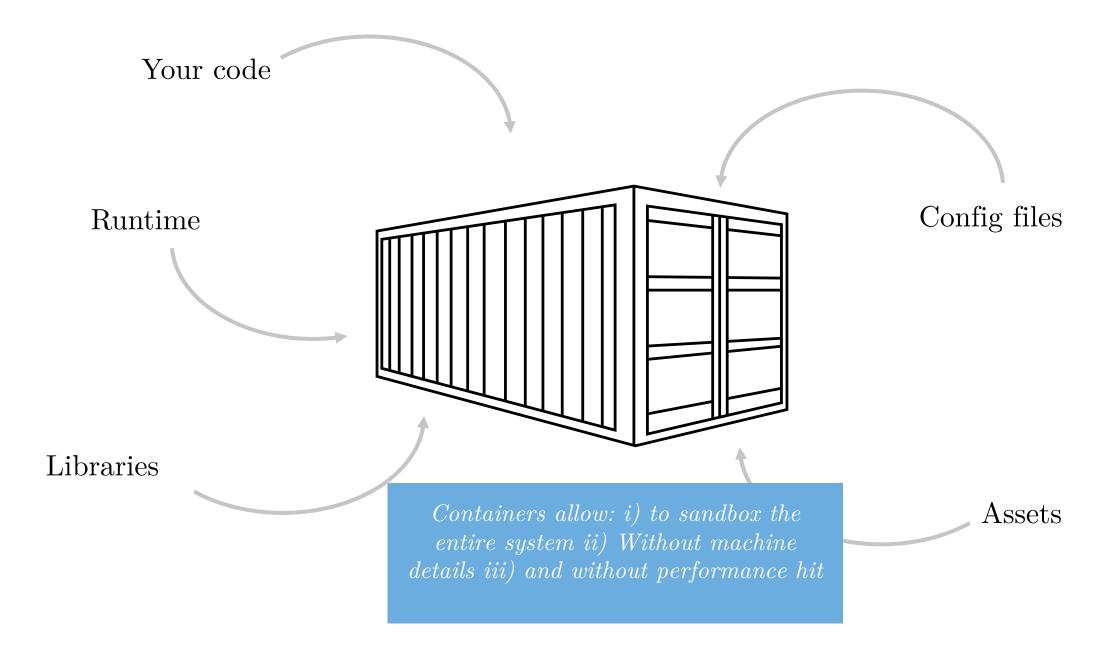

## Containers vs. VMs

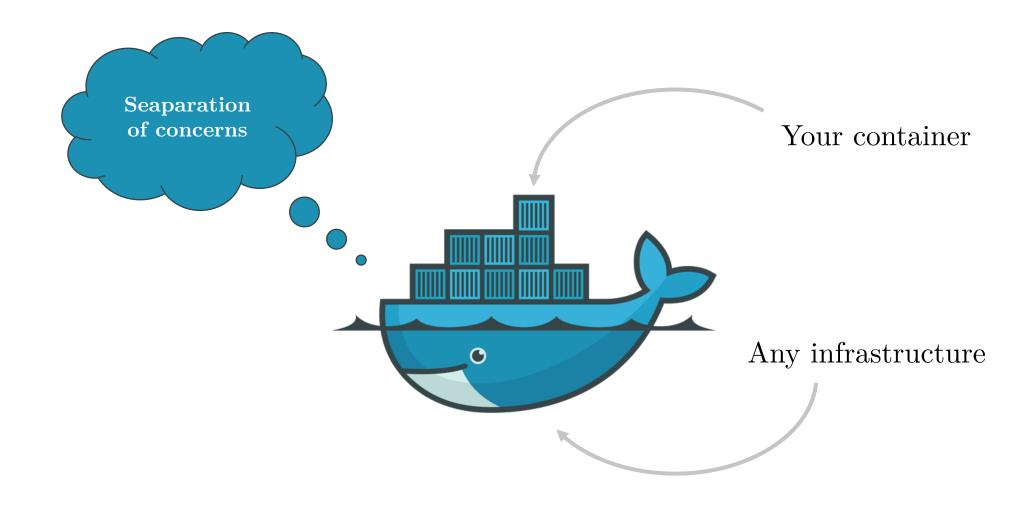

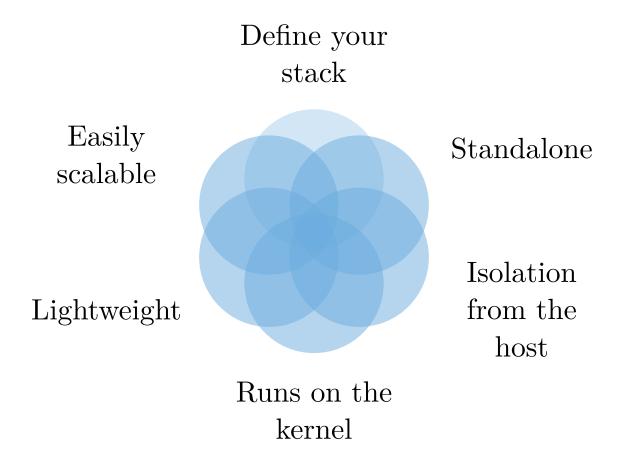

## What containers are all about

## **Containers allow UDSS**

<u>User Defined Software Stack</u>

### What are containers?

#### Image

The way container software is shipped.

- Static, standardized, and portable filesystem snapshot with a predefined executable command or entry point.
- Images are built and can be stored and distributed.
- Images are a tool for reproducibility used to ship fully built with packaged versions of agreentable all the components, assets etc.

#### Container

Isolated environment for running processes.

- Running instance of an image.
- Runs on a host machine and shares the kernel with OS.
- The processes running in the container are isolated from the rest of the system.
- Containers are a tool for isolation where components are segregated, providing better security and

#### **Orchestrator**

Makes containers manageable.

- Automates the lifecycle of containers, networking, storage...
- Organizes containers into abstract services and handles dependencies. It allows to declaratively describe how containers should behave.
- An orchestrator is a tool for managing complex applications by providing load balancing, monitoring, automated restarts, version migration, and many other convenience capabilities.

Hands-on #1: Docker kickstarter

#### Hands-on #1

## Your first steps with containers

Let's get into the workbench.

(easy) coder ide (advanced) SSH

## Your first steps with containers

docker -v, ps, image
 ls

hello-world

alpine interactive

- hostname
- ps aux
- apk

Create / delete files

Page 6 in handout

#### The bolts and nuts of containers

#### namespaces

- Provide an isolated view of the resources on the systems to processes running in a container
- Impossible for them to escape and see what's happening elsewhere
- Whether it is the host or other containers running next to them.

#### cgroups

- Control the hierarchical resource management and constraints
- Enforcing resources quotas (e.g., CPU, RAM, I/O, bandwidth usage...)

Appendix A for more details

### The bolts and nuts of containers

- > Containers are not a virtualization technology
- >> Linux uses namespaces and cgroups. The system is a big container.
- >>> Even when you're not in a container, you are in a container.

There is no performance hit.

I repeat, there is no performance hit.

## The bolts and nuts of containers (performance)

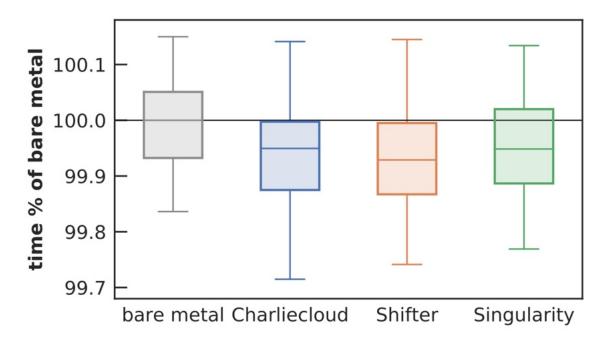

Fig. 1. SysBench prime number computation time relative to median bare metal performance of 129.36 seconds; lower is better. Boxes show the median and middle 50%, while whiskers show the maximum and minimum. The four environments showed essentially identical performance.

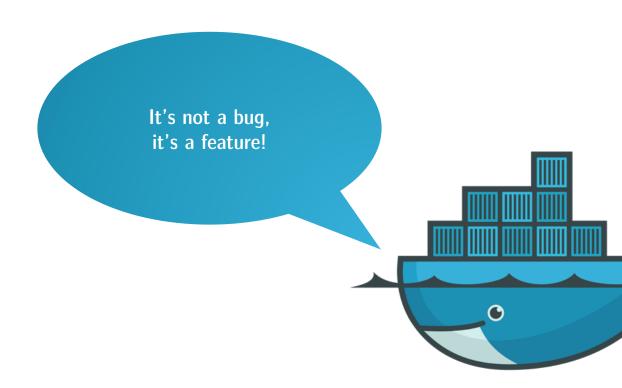

A. Torrez, T. Randles, and R. Priedhorsky, "HPC Container Runtimes have Minimal or No Performance Impact," in 2019 IEEE/ACM International Workshop on Containers and New Orchestration Paradigms for Isolated Environments in HPC (CANOPIE-HPC), Nov. 2019, pp. 37–42. doi: 10.1109/CANOPIE-HPC49598.2019.00010.

> Not to metion the time spared for humans (dev and ops)

#### The bolts and nuts of containers

Irz

- Containers are ephemeral
- No data is persisted in a container
- Containers are meant to be stateless.
  - No state
  - No information related to the state: amnesic
  - Just get the job done
  - Separation of data and process
- Containers can be replicated
  - No state = each container is the same
  - Allow for horizontal scaling

## **Volume mapping**

```
Irz
```

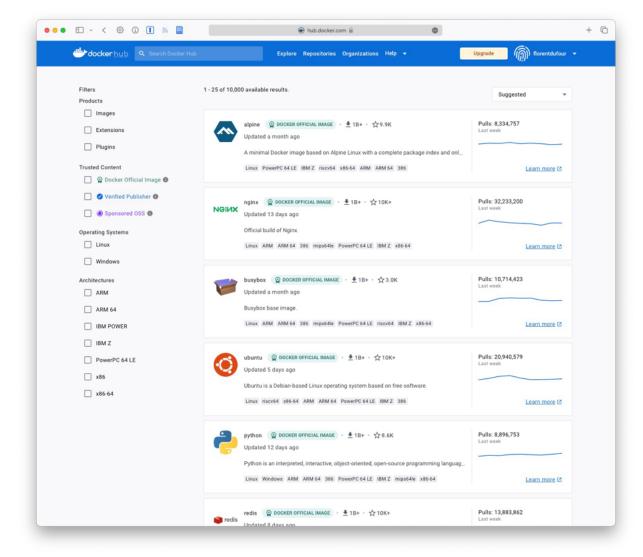

```
# ON THE HOST #
               # Let's create a sample directory
               # Its content will be mapped to the container
               mkdir /tmp/data
               # Let's create some files
               echo "Monday, Tuesday, Wednesday"
                                                   > /tmp/data/week.txt
               echo "Jeudi, Vendredi, Samedi"
                                                   > /tmp/data/semaine.txt
                                                   > /tmp/data/woche.txt
               echo "Sonntag, Sonntag, Sonntag"
               # -v let us map volumes with the syntax: <path_on_host>:<path_in_container>
               docker run \
                   -it \
                   --rm \
                   --name weeks \
                   --hostname weeks \
                                                container
host
                   -v /tmp/data:/data
                   alpine
                 IN THE CONTAINER #
               ls -lah /data/
               # total 20K
                                                      4.0K Mar 26 10:07 .
               # drwxr-xr-x
                              2 root
                                          root
               # drwxr-xr-x
                              1 root
                                          root
                                                      4.0K Mar 26 10:08 ...
                                                        24 Mar 26 10:07 semaine.txt
                              1 root
               # -rw-r--r--
                                          root
                                                        27 Mar 26 10:07 week.txt
                              1 root
               # -rw-r--r--
                                          root
                                                        26 Mar 26 10:07 woche.txt
                              1 root
               # -rw-r--r--
                                          root
               # You can escape the container without killing it
               # With ctrl-P ctrl-Q
```

## Volume and port mapping

```
# Let's expose a service, for example a website!
    # Create your website
    echo "<h1>Welcome...</h1>...to my awesome website running in a container ;-)
        >" > index.html
      -p lets us map ports with the syntax: <port_on_host>:<port_in_container>
      -v lets us mount the persitent file to the container
host# -d Lets us run the container in detached mode (i.e. in the background)
     # caddy is a web server. containerginx or apache, but shinier!
      cker run \
        --name webserv
        -p 8888:80 \
        -v $PWD Index.html:/usr/share/caddy/index.html \
                                                                              0 >>
        caddy
                                                                                               Welcome...
    # Visit http://<IP address>:8888 with your browser to see your website
                                                                              ...to my awesome website running in a container ;-)
```

## Find the image you need: The Docker Hub

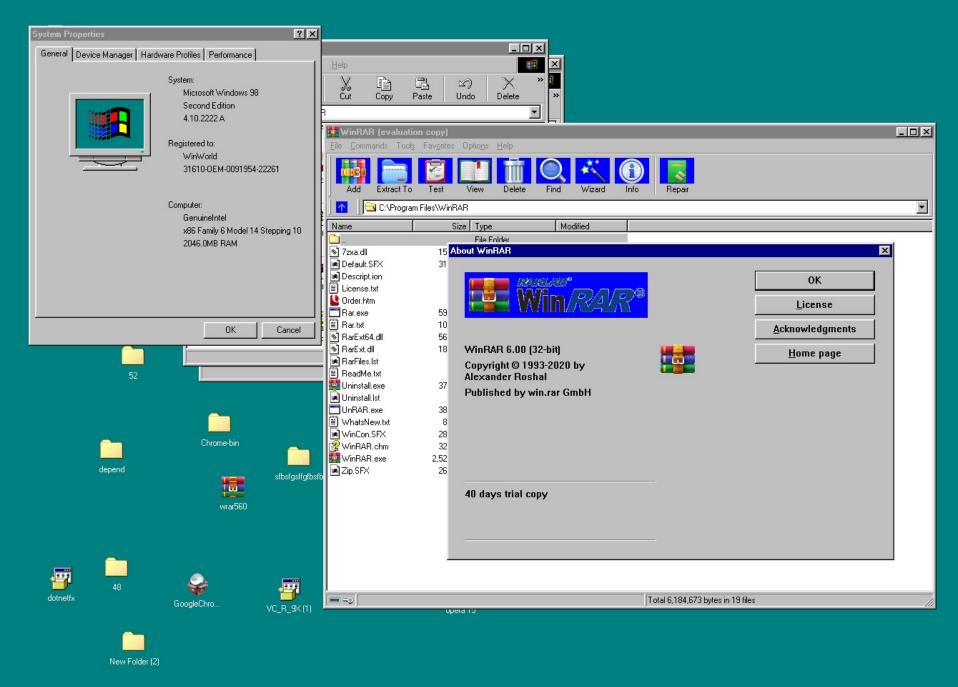

https://hub.docker.com

## How to create and use your own custom image

"Commit" a container

Create a "Dockerfile"

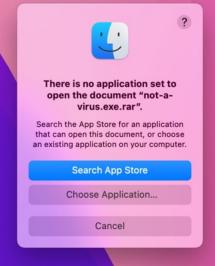

## Don't: Create and use your own custom image (commit)

```
---- #
 On the host #
  ---- #
docker image ls
# REPOSITORY
                                                05743
 alpine
                                                            5 weeks ago
# Only alpine is available as an ima
# Let's customize it in order to use it to extract exotic rar files
docker run -it alpine
 In the container #
 ----- #
# We add a package to the container

   5.61MB
# A new image is created, we can now run alpine container with unrar installed
   already!
```

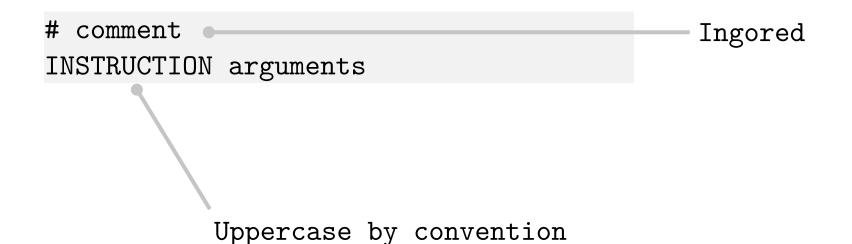

## Do: Create and use your own custom image (Dockerfile)

Create an empty directory

The file must be named Dockerfile

The format is *very* simple:

## Create and use your own custom image (Dockerfile)

```
Command to execute when
                                Volume
                                           starting container
         Command to execute
 Parent image
FROM alpine: latest
RUN apk update && apk add unrar
VOLUME Tata_to_urrar
ENTRYPOINT /usr/bin/unrar
# Then build the image with:
# docker build . -t "alpine_unrar" -
                                         Tag of the image "name:version"
```

Directory containing the Dockerfile

## Create and use your own custom image (Dockerfile)

```
~$ ls -lah
232 -rw-r--r-0 1 di67pif wheel 115K Apr 14 17:23 Module-3_220420.pptx
2056 -rw-r--r-0 1 di67pif wheel 977K Apr 19 11:40 not-a-virus.exe.rar

~$ docker run -v $PWD:/data_to_unrar alpine_unrar not-a-virus.exe.rar

~$ ls -lah
232 -rw-r--r-0 1 di67pif wheel 115K Apr 14 17:23 Module-3_220420.pptx
2056 -rw-r--r-0 1 di67pif wheel 977K Apr 19 11:40 not-a-virus.exe.rar
2056 -rw-r--r-0 1 di67pif wheel 2.1M Apr 19 11:43 not-a-virus.exe
```

#### **Under the Hood of Containers**

## Example: Create and use your own custom image (Dockerfile)

```
FROM ubuntu:bionic
RUN apt-get update
RUN apt-get -y upgrade
RUN apt-get -y install python3 python3-pip
COPY ./requirements.txt /tmp/requirements.txt
COPY ./app /app
RUN pip install -r /tmp/requirements.txt
ENV DEBUG=true
WORKDIR /app
ENTRYPOINT ./main.py
```

- ~\$ docker build . -t "my-image:1.0"
- ~\$ docker run my-image:1.0

#### **Under the Hood of Containers**

# Irz

## Create and use your own custom image (Dockerfile)

Instruction	Description
FROM	Set the parent image for the subsequent instructions (must be the first line) e.g., FROM alpine:latest
LABEL	Adds metadata to an image e.g., LABEL maintainer="Florent Dufour <florent@lrz.de>"</florent@lrz.de>
ARG	Defines a variables for build time or runtime
RUN	execute any commands in a <u>new layer</u> on top of the current image and <u>commit the results</u> . The resulting committed image will be used for the next step e.g., (shell form), RUN apt-get update e.g. (exec form) RUN ["apt", "update"]
WORKDIR	sets the working directory for any command to follow
ENV	Set environment variables that must be persistent after image build e.g., ENV DB_PASSWORD="Chang3me!"
USER	Sets the user name (or UID) and optionally the user group (or GID) to use when running the image and for later commands to run
ADD	Add files, directories or remote file URLs from to the filesystem of the image. It supports wildcards. Automatically expand archives  Can be unpredictable. e.g., ADD /source/file/path /destination/path e.g., ADD http://example.com/file.txt /destination
COPY	Newer than ADD but with limited functionalities. Much safer and predictable, prefer using COPY over ADD e.g., COPY /host/source/file/path /container/destination/path
VOLUME	creates a mount point with the specified name and marks it as holding externally mounted volumes from native host or other containers
EXPOSE	Make the container listen to a specific port at runtime. Can specify UDP/TCP. Must be used with -p when runing container e.g., EXPOSE 8090
ENTRYPOINT	Configure a container that will run as an executable. Either a command in \$PATH or an executable

Hands-on #2: Dream in a container

## Make an ANN dream in a container - History

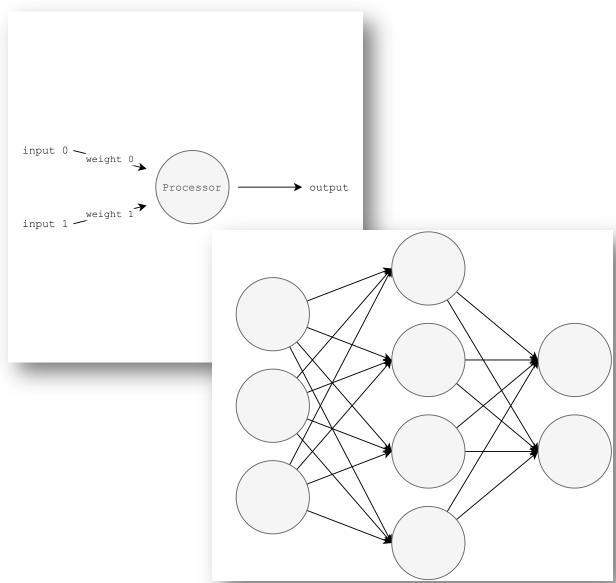

"DeepDream is a computer vision program created by Google engineer Alexander Mordvintsev that uses a convolutional neural network to find and enhance patterns in images via algorithmic pareidolia, thus creating a dream-like hallucinogenic appearance in the deliberately over-processed images"

## Make an ANN dream in a container – ANN?

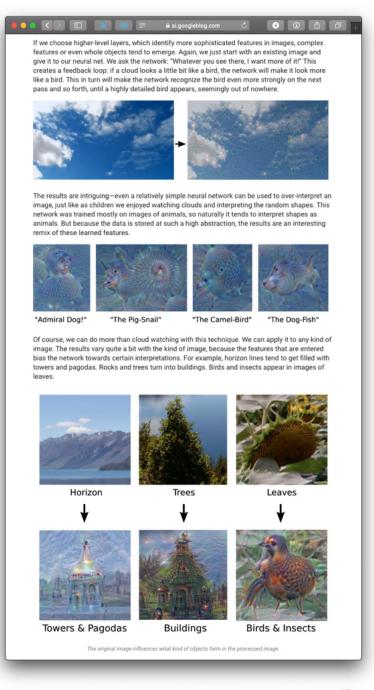

- Like in the brain: a "neuron" lives in a network, receives inputs, processes them, and generates an output.
- An ANN is a "connectionist" computational system that processes information collectively, in parallel throughout a network of neurons organized in layers.
- An ANN is adaptive and has the ability to learn by changing its internal structure based on the information flowing through it.
- This is achieved by tuning weights, the number that controls the signal between two neurons.
- Today, ANN are used to perform "easy-for-a-human, difficult-for-a-machine" tasks like optical character recognition, image classification, and speech and facial recognition for example.

## Make an ANN dream in a container - History

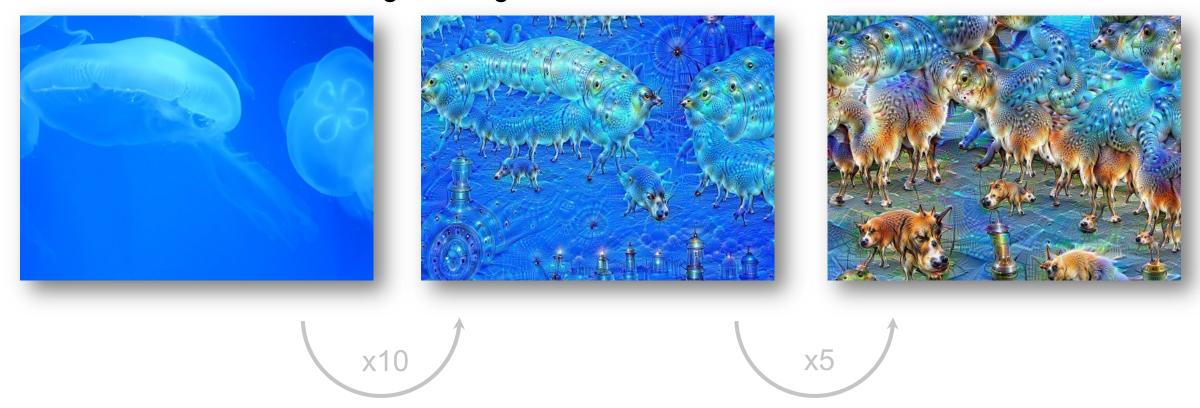

- Originally designed to detect patterns in images for classification (what ANN are good at!)
  - Ex: Find features of a dog: Fur, Dog snout then it's a 🧆
  - Ex: Find features of a fork: a handle and 2-4 times and ignore what doesn't matter (size, color, number of teeth, orientation): it's a
- Arised the question: Why do some models perform well and others don't?
- Idea: Reverse the process! And peek into the network
  - What is happening in each layer?
  - Pick a layer and enhance whatever is detected
  - Elicit a particular interpretation: What layer is responsible for what feature?

## Make an ANN dream in a container - History

## With an ANN trained to recognize dogs

## Make an ANN dream in a container - Why

- ♥ It's cool
- Tt requires quite a sophisticated setup
- It will make use of what we've seen before
- We'll be proud when we'll get it working

## Make an ANN dream in a container – How: Recommendation

- We already have a Jupyter Notebook
- We have to build an image in which the notebook can run
  - Install the dependencies python3-dev and python3-pip with apt
  - Install the dependencies tensorflow matplotlib and jupyterlab with pip
  - Copy the notebook with the container
- We will run a container out of this image and map the port 8888:8888 to access the interface to execute the code from the Jupyter notebook

## Make an ANN dream in a container - How

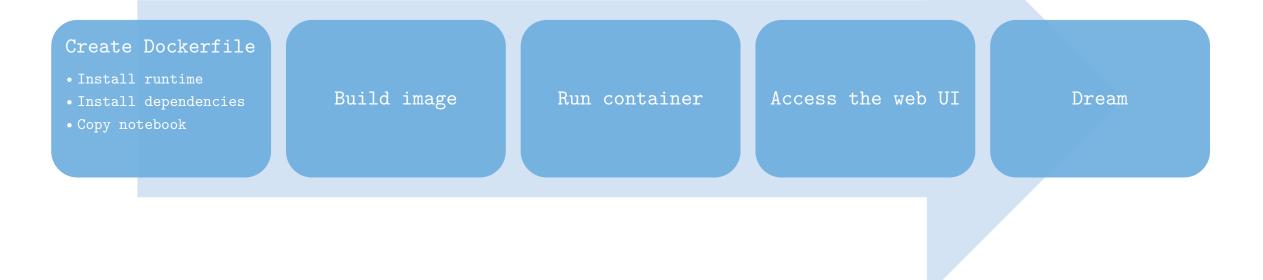

git clone <a href="https://github.com/LRZ-BADW/AITS-containers.git">https://github.com/LRZ-BADW/AITS-containers.git</a>

➤ 2-Deep-Learning > question

## Make an ANN dream in a container

## Make an ANN dream in a container – solution

- You can look into the solution subfolder
- You can run the full solution with make solution
- You can individually perform build and run tasks
  - make build
  - make run

## **Containers and Al**

#### Containers and Al

## Rationale

## 1. AI workloads are inherently very heterogeneous

- Software: Python 3.x, PyTorch, RAG, Front-end etc.
- Example AUTOMATIC1111/stable-diffusion-webui (what a mess...)

## 2. AI workloads need to be portable (MLOps)

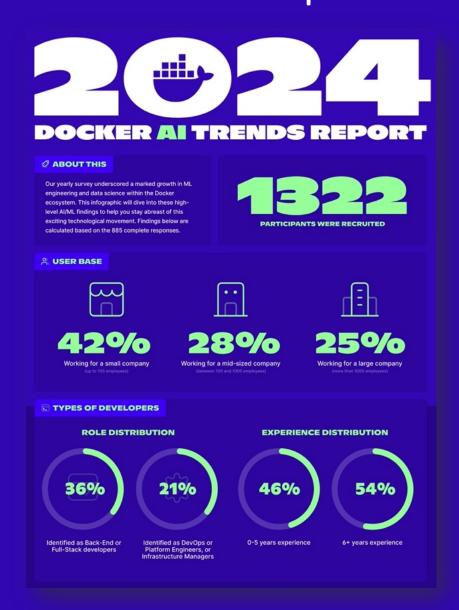

- Local development (laptop / workstation)
- Remote training (AI GPU Cluster)
- Cloud inference

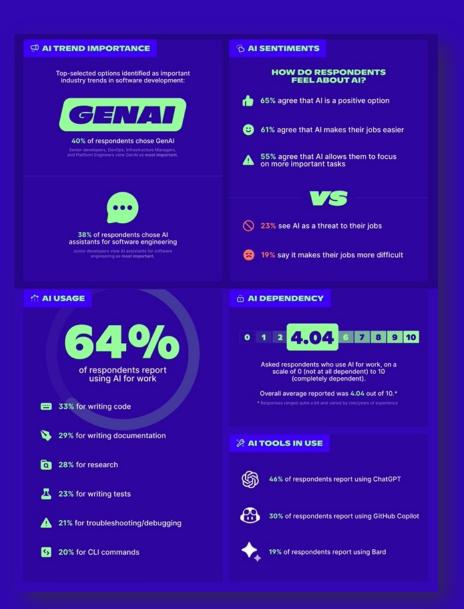

## 3. AI community tend to be younger

- early adopters of new technology like containers
- More open to "new" paradigms like containers
- Often prefers ease of use

# Containers and Al Trends and Recent Developments

Containers, performances, and security

### **Switching** gears

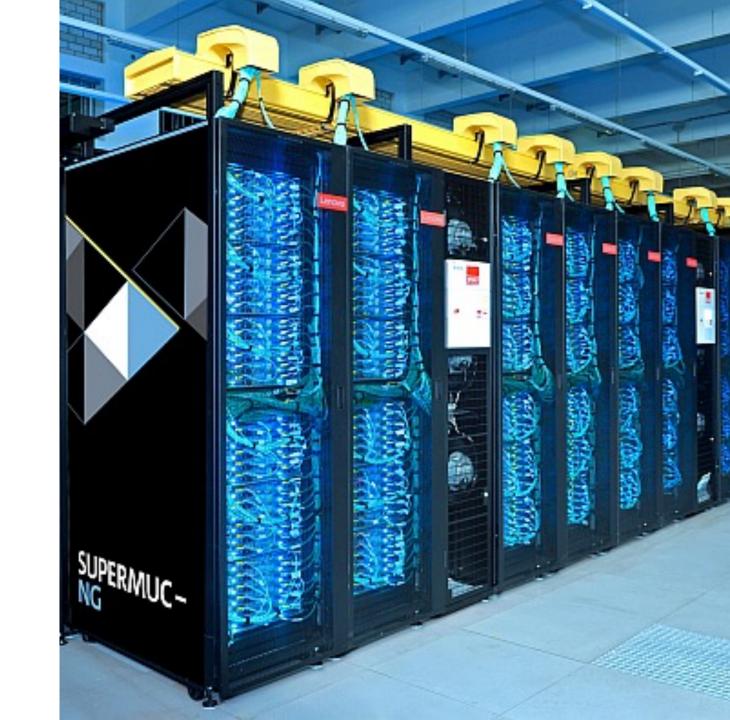

## Performances and security

## What you get:

- High Performance
- Massive distribution

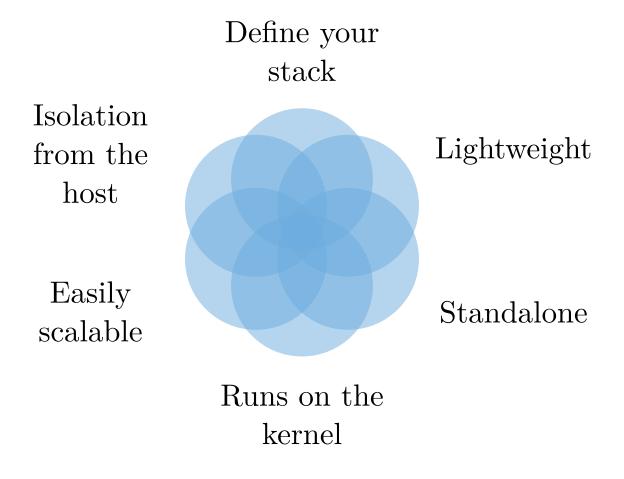

## What you don't get:

- Root access
- Internet access
- Choice of OS
- `apt install exotic-library`
- > Need for UDSS!

## **Containers allow UDSS**

<u>User Defined Software Stack</u>

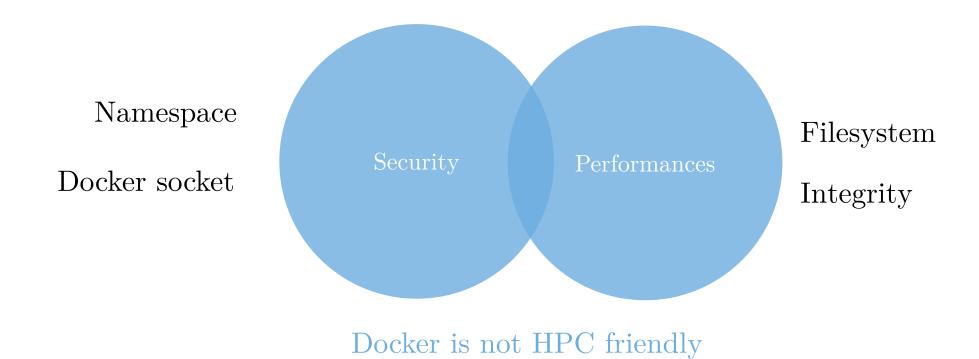

## Containers are appealing for HPC

- UDSS
  - Circumvent root access
  - Use exotic libraries and framework
  - A researcher must research
- Bare metal performances
- Security
- Less burden on HPC staff = better support

## Performances and security

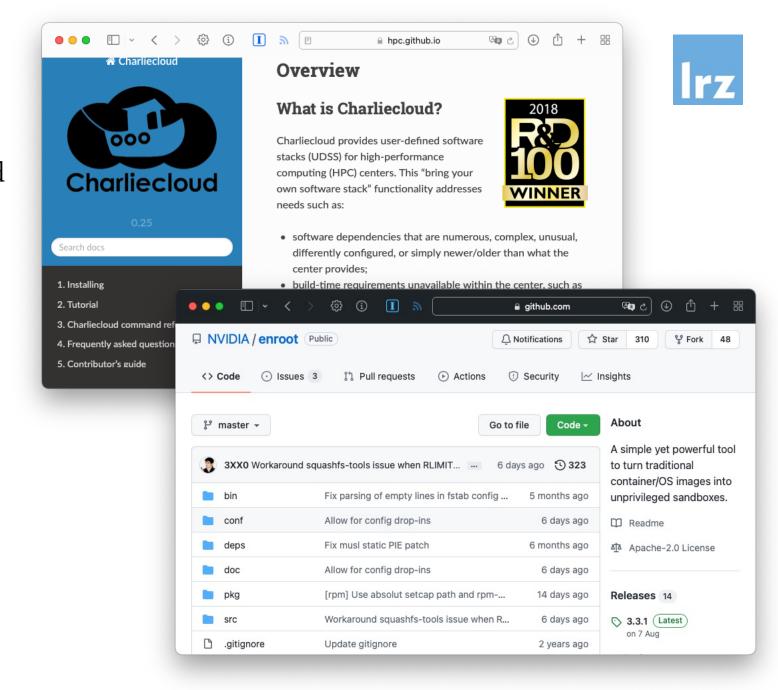

#### **Switching gears**

## Performances and security

- Still relies on Docker images and Dockerfile as they are widespread <u>BUT</u> do not require any privileged operation
- Makes use of the unprvileged user namespace
- 1. Create your docker image
- 2. Convert and flatten the image
- 3. Upload it to the HPC system
- 4. Submit your job with a slurm script

# Switching gears UDSS at LRZ

## Charliecloud

#### HPC systems

- Use docker image
- Create a tar file
- chroot into it
- Run isolate from the system
- Fake root inside the container

#### enroot

#### AI systems

- Use docker images (from Docker Hub or NGC catalog)
- Run in user space
- Flow: import, create, start
- sqsh images
- Associated with a scheduler
- More adapted to AI

Hands-on #3: Containers and HPC

#### **Containers and HPC**

## Whisper.cpp

https://github.com/ggerganov/whisper.cpp

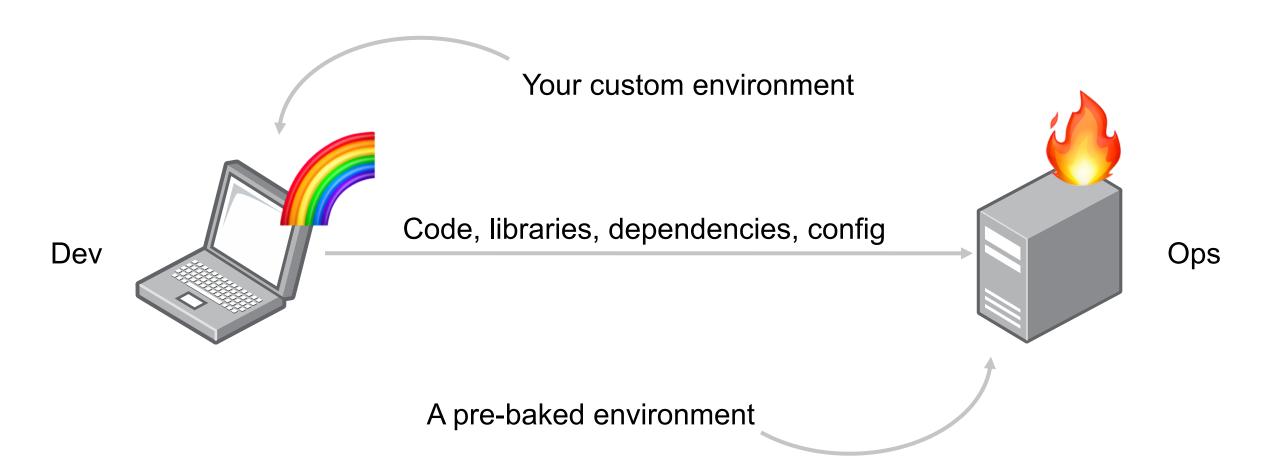

- In the question, we provide Dockerfile. You need to
  - Build the image
  - Convert to enroot
  - Create an enroot container
  - Start it while mounting /data to get audio files and a model
- You can convert speech to text!
- You can also go into the solution and use make solution

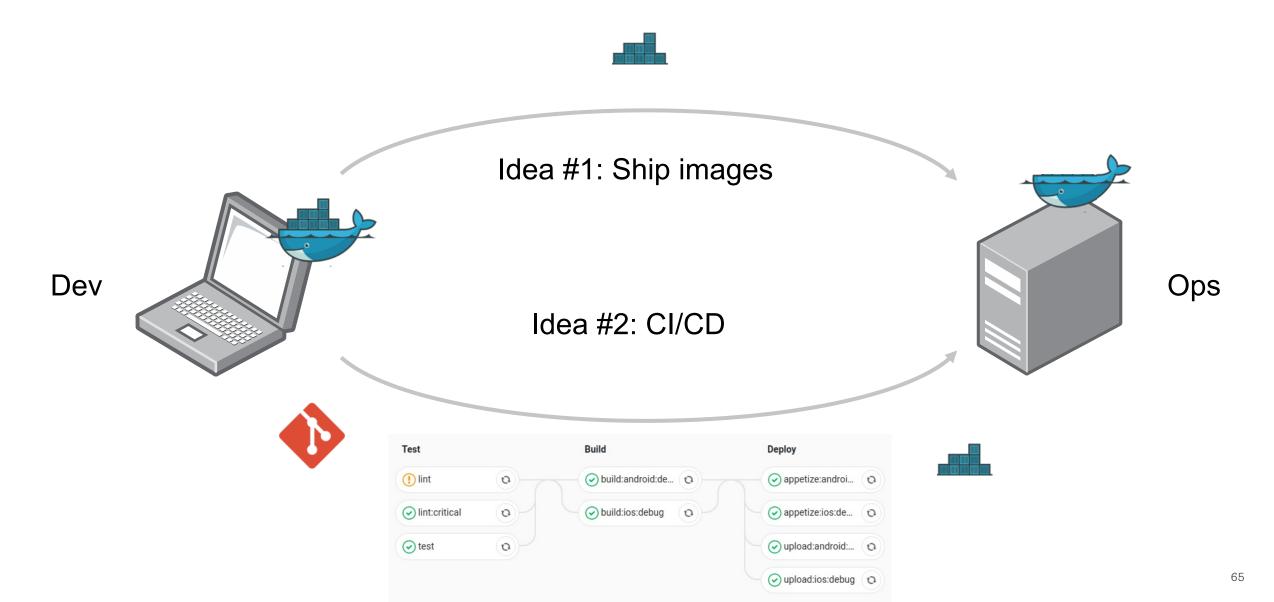

## **Abstraction**

## **Abstraction: CI/CD**

## **Abstraction: Reproducible scientific pipelines**

#### POLICYFORUM

#### **Accessible Reproducible Research**

cientific publications have at least two Sgoals: (i) to announce a result and (ii) to convince readers that the result is correct. Mathematics papers are expected to contain a proof complete enough to allow knowledecable readers to fill in any details. Papers in experimental science should describe the results and provide a clear enough protocol to allow successful repetition and extension.

Over the past ~35 years, computational science has posed challenges to this traditional paradigm-from the publication of the four-color theorem in mathematics (1), in which the proof was partially performed by a computer program, to results depending on computer simulation in chemistry, materials science, astrophysics, geophysics, and climate modeling. In these settings, the scientists are often sophisticated, skilled, and innovative programmers who develop large, robust software packages.

sets are often analyzed many times, with modi-nents and the precise details of their use. fications to the methods and parameters, and sometimes even updates of the data, until the Reproducible Research lication often gives only scant attention to the way to encapsulate all aspects of our in silico System (RRS), consisting of two componen these papers are "merely the advertisement of independent replication by another scientist Environment (RRE) for doing the computainput data, parameter values, etc. embody the refer to this goal as "reproducible research" tools together with the ability to automatically final analysis may be lost or unrecoverable.

## Abstraction: Reproducible scientific pipelines

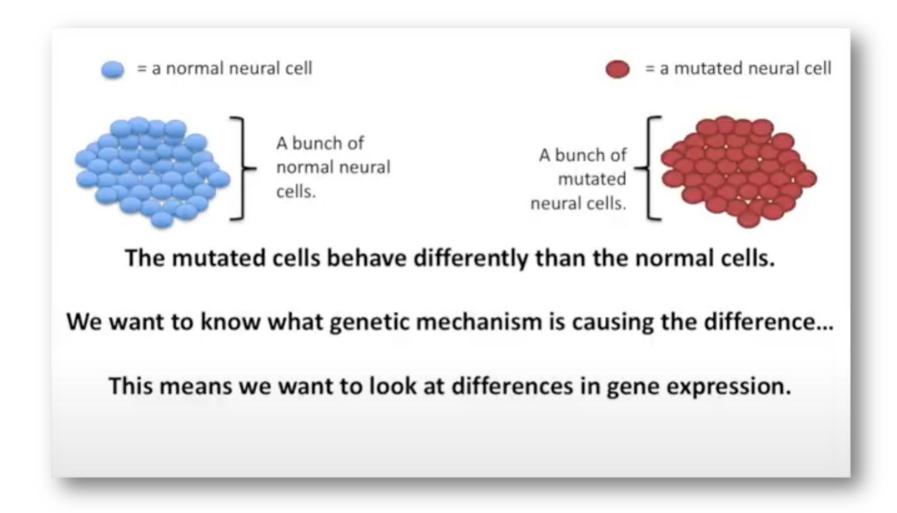

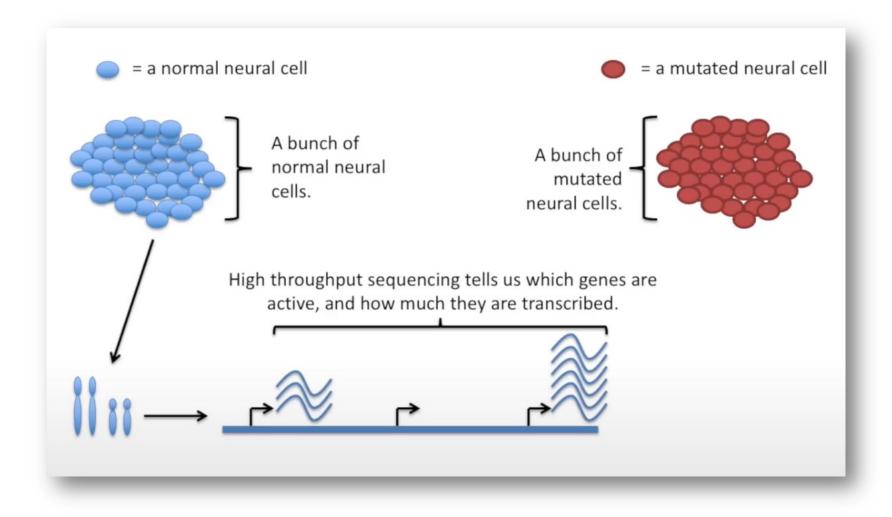

## What is RNA-seq (StatQuest)

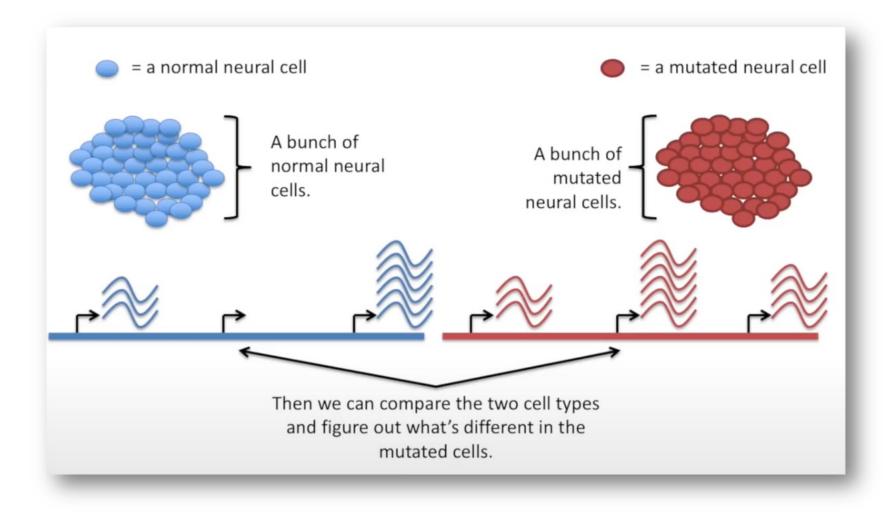

## What is RNA-seq (StatQuest)

## What is RNA-seq (StatQuest)

## What is RNA-seq

We measure the gene expression in both cell populations and compare the results to see what's happening in the mutated cells.

A RNA-Seq experiment usually occurs in 3 main steps:

- i) Biological sample preparation (preparation of the library)
- ii) Sequencing
- iii) Data analysis

An illumina sequencer

## What is RNA-seq (Data analysis)

## Data analysis:

- FastQC: To quality check the sequencing. Sequences with poor quality must be trimmed or filtered.
- MultiQC: Also to quality check, with additional information.
- Salmon: That must be run after the quality check and reads filtering. Salmon allows the mapping of high quality reads on a genome and a genes set in order to establish the differential gene expression.

## What is RNA-seq (Data analysis)

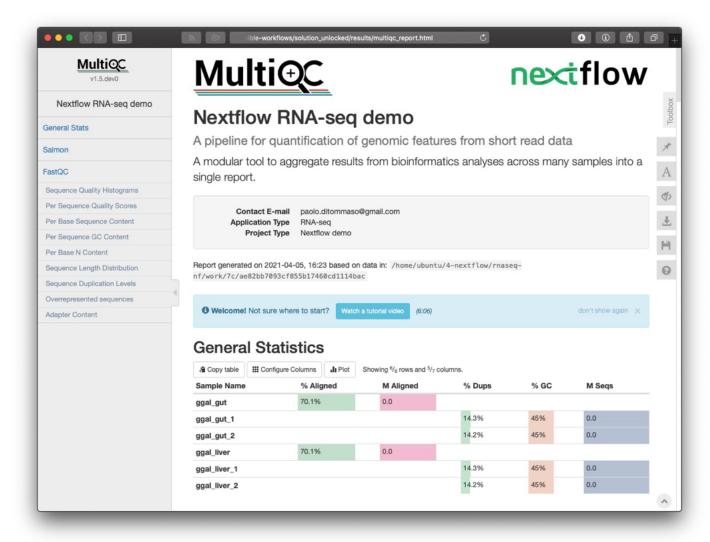

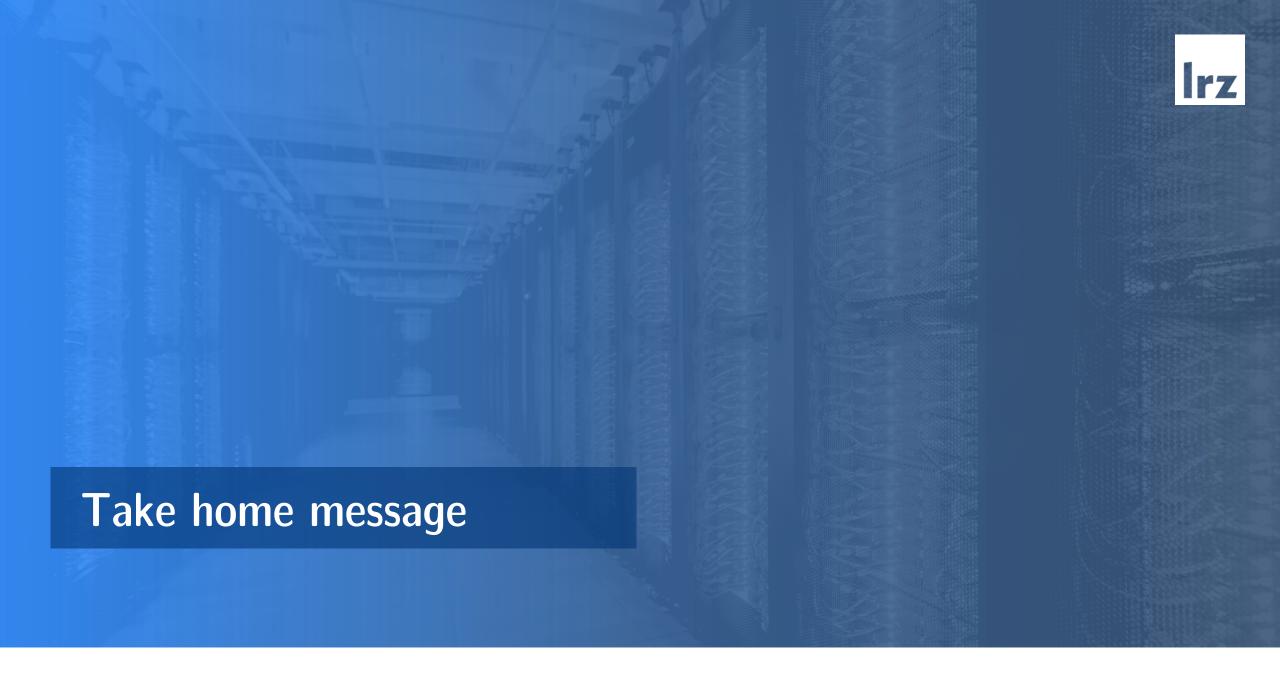

```
# Let's get the Nextflow code along with the dataset
git clone "https://github.com/nextflow-io/rnaseq-nf.git"
#Cloning into 'rnaseq-nf' ...
# And run the pipeline locally in a docker container
cd rnaseq-nf
nextflow run nextflow-io/rnaseq-nf -with-docker
#RNASEO-NF PIPELINE
  transcriptome: /home/ubuntu/.nextflow/assets/nextflow-io/rnaseq-nf/data/ggal/
   ggal_1_48850000_49020000.Ggal71.500bpflank.fa
               : /home/ubuntu/.nextflow/assets/nextflow-io/rnaseq-nf/data/ggal/*
  reads
   {1,2}.fq
  outdir
              : results
 executor > local (6)
  [06/dd0ce9] process > RNASEQ:INDEX (ggal_1_48850000_49020000) [100%] 1 of 1 /
 [a5/514067] process > RNASEQ: FASTQC (FASTQC on ggal_liver)
                                                               [100%] 2 of 2 /
 [9c/af0a9d] process > RNASEQ:QUANT (ggal_liver)
                                                               [100%] 2 of 2 /
 [70/d1650e] process > MULTIQC
                                                               [100%] 1 of 1 /
 Done! Open the following report in your browser --> results/multiqc_report.html
 That's it! The rport is published in the results folder!
 Use scp to get visualize it on your local machine
```

Can you use the caddy web server (as illustrated on code snippet 6) to expose the result of the pipeline as a web page accessible on port 8888?

## What is RNA-seq (Data analysis)

Containers are the ephemeral running instance of an environment: an application, its runtime, dependencies, libraries, settings etc.

Virtual Machine (VM)s are cooler than containers

Containers can not mount volumes from the host and expose ports.

Containers can be committed to images, manually or thanks to a Domain-Specific Language (DSL) like the Dockerfile.

The syntax of the Dockerfile is expressive.

The Dockerfile is the cornerstone of all container platforms.

They are easy to write, share, and build.

One can convert a Docker image to other format like enroot and Charliecloud which are suited to HPC applications

## **Containers allow**

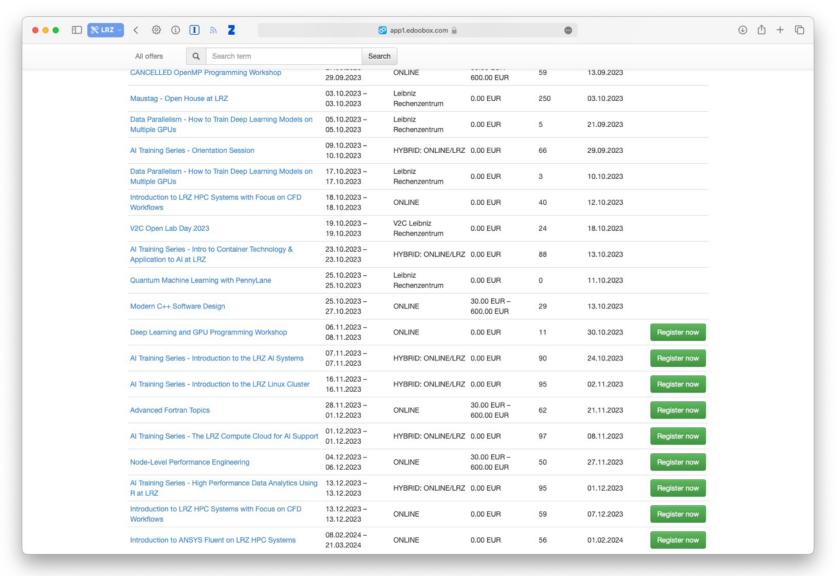

Containers allow consistency and reproducibility:
software build, scientific pipelines etc.
You to spend more time on your research that managing software
